

27 September 2010

Correction Notice

The Blue Book

2010 Edition

A production error affecting series estimates for IHXT and IHXW in Table 1.5, Population, employment and GDP per head for the periods 2001 to 2005, originally published on 12 July 2010, has been corrected.

In addition, a production error affecting estimates in tables 1.7.8 and 1.7.9, UK summary accounts 2009, originally published on 12 July 2010, has been corrected. The error affected financial account and financial account balance sheet estimates for 2009.

ONS apologises for any inconvenience caused.

A National Statistics publication

National Statistics are produced to high professional standards as set out in the Code of Practice for Official Statistics. They are produced free from political influence.

About us

The Office for National Statistics

The Office for National Statistics (ONS) is the executive office of the UK Statistics Authority, a non-ministerial department which reports directly to Parliament. ONS is the UK government's single largest statistical producer. It compiles information about the UK's society and economy, and provides the evidence-base for policy and decision-making, the allocation of resources, and public accountability. The Director-General of ONS reports directly to the National Statistician who is the Authority's Chief Executive and the Head of the Government Statistical Service.

The Government Statistical Service

The Government Statistical Service (GSS) is a network of professional statisticians and their staff operating both within the Office for National Statistics and across more than 30 other government departments and agencies.

Preface

The annual Office for National Statistics (ONS) *Blue Book* publication contains the estimates of the domestic and national product, income and expenditure of the United Kingdom.

The presentation of accounts is based on the *European System of Accounts 1995* (ESA95), which is itself based on the *System of National Accounts 1993* (SNA93). The SNA93 has been adopted worldwide.

Quarterly estimates

Quarterly estimates of the main components of the National Accounts for the last few years are published in ONS *Statistical Bulletins* and, in more detail with commentary, in the *United Kingdom Economic Accounts* (UKEA).

A number of long-run quarterly and annual estimates consistent with the *Blue Book* are available in the on-line publication *Economic & Labour Market Review* (ELMR). The latest estimates are also given in summary form in the *Monthly Digest of Statistics*, and the quarterly income, capital and financial accounts for each sector are published regularly in *Financial Statistics*.

ONS data and publications website (www.ons.gov.uk)

Users can download time series, cross-sectional data and metadata from across the Government Statistical Service (GSS) using the site search and index functions from the homepage. Many datasets can be downloaded, in whole or in part, and directory information for all GSS statistical resources can be consulted, including censuses, surveys, periodicals and enquiry services. Information is posted as PDF electronic documents or in XLS and CSV formats, compatible with most spreadsheet packages.

Time series data

The Time series data facility on the website provides access to around 40,000 time series, of primarily macro-economic data, drawn from the main tables in a range of our major economic and labour market publications. Users can download complete releases, or view and download customised selections of individual time series.

National Statistics data

All data in the *Blue Book* are fully compliant with the Code of Practice for Official Statistics.

Comments and enquiries

ONS looks forward to receiving comments on its publications.

Suggestions for improvements or alterations to the *Blue Book* can be sent in writing to:

The *Blue Book* is a collaborative effort. ONS is grateful for the assistance provided by the various government departments and organisations that have contributed to this book.

An introduction to the United Kingdom National Accounts

The *Blue Book* presents the full set of economic accounts, or National Accounts, for the United Kingdom. These accounts are compiled by the Office for National Statistics (ONS). They record and describe economic activity in the United Kingdom and as such are used to support the formulation and monitoring of economic and social policies.

This edition of the *Blue Book* presents estimates of the UK domestic and national product, income and expenditure covering the calendar years 2000–09. The tables of the main aggregates are extended to cover 1994–99 on a consistent basis. Data for 2009 are not yet available for the production account, the generation of income account, Input-Output Supply and Use Tables and for the full detailed industrial analysis of gross value added and its income components.

The accounts are based on the European System of Accounts 1995 (ESA95),¹ itself based on the System of National Accounts 1993 (SNA93),² which is being adopted by national statistical offices throughout the world. The UK National Accounts have been based on the ESA95 since September 1998. The 1998 edition of the *Blue Book* explains the main changes; a more detailed explanation of changes can be found in *Introducing the ESA95 in the UK*.³ A detailed description of the structure for the accounts is provided in a separate National Statistics publication *UK National Accounts Concepts, Sources and Methods*.⁴

This introduction gives a brief overview of the accounts, explains their framework and sets out the main changes included in this edition of the *Blue Book*. Definitions of terms used throughout the accounts are included in the glossary. Explanations of more specific concepts are provided within the relevant parts.

The *Blue Book* comprises five parts:

- **Part 1** provides a summary of the UK National Accounts along with explanations and tables that cover the main national and domestic aggregates, for example gross domestic product (GDP) at current market prices and chained volume measures and the GDP deflator; gross value added (GVA) at basic prices; gross national income (GNI); gross national disposable income (GNDI); and where appropriate their equivalents net of capital consumption; population estimates; employment estimates and GDP per head; and the UK summary accounts (the goods and services account, production accounts, distribution and use of income accounts and accumulation accounts). It also includes details of revisions to the data.

- **Part 2** includes Input-Output Supply and Use Tables and analyses of gross value added at current market prices and chained volume measures, capital formation and employment, by industry.
- **Part 3** provides a description of the institutional sectors as well as explaining different types of transactions, the sequence of the accounts and the balance sheets. Explanation is also given of the statistical adjustment items needed to reconcile the accounts. This part comprises the fullest available set of accounts showing transactions by sectors and appropriate sub-sectors of the economy (including the rest of the world).
- **Part 4** covers other additional analyses. It includes tables showing the percentage growth rates of the main aggregates and supplementary tables for capital consumption, gross fixed capital formation, capital stock, non-financial balance sheets, public sector data, and GNI and GNP consistent with the ESA79 compiled for EU budgetary purposes.
- **Part 5** covers environmental accounts.

Overview of the accounts

In the UK, priority is given to the production of a single estimate of GDP using the income, production and expenditure data. The income analysis is available at current prices, expenditure is available at both current prices and chained volume measures, and value added on a quarterly basis is compiled in chained volume measures only. Income, capital and financial accounts are also produced for each of the institutional sectors: non-financial corporations, financial corporations, general government and the households and non-profit institutions serving households sectors. The accounts are fully integrated, but with a statistical discrepancy, known as the statistical adjustment, shown for each sector account (reflecting the difference between the sector net borrowing or lending from the capital account, and the identified borrowing or lending in the financial accounts which should theoretically be equal). Financial transactions and balance sheets are also produced for the rest of the world sector in respect of its dealings with the UK.

Summary of Changes

While the structure in this edition of the *Blue Book* remains very close to last years publication, the reference year has been moved on one year, so that the latest base year for the chained volume measure of GDP is 2006.

The basic framework of the UK National Accounts

The accounting framework provides for a systematic and detailed description of the UK economy. It includes the sector accounts, which provide, by institutional sector, a description of the different stages of the economic process from production through income generation, distribution and use of income to capital accumulation and financing; and the Input-Output framework, which describes the production process in more detail. It contains all the elements required to compile aggregate measures such as GDP, gross national income (previously known as gross national product), saving and the current external balance (the balance of payments). The economic accounts provide the framework for a system of volume and price indices, so that chained volume measures of aggregates such as GDP can be produced. It should be noted that in this system, value added, from the production approach, is measured at basic prices (including other taxes less subsidies on production but not on products) rather than at factor cost (which excludes all taxes less subsidies on production). The system also encompasses measures of population and employment.

The whole economy is subdivided into institutional sectors. For each sector, current price accounts run in sequence from the production account through to the balance sheet.

The accounts for the whole UK economy and its counterpart, the rest of the world, follow a similar structure to the UK sectors, although several of the rest of the world accounts are collapsed into a single account because they can never be complete when viewed from a UK perspective.

The table numbering system is designed to show the relationships between the UK, its sectors and the rest of the world. A three-part numbering system (for example, 5.2.1) has been adopted for the accounts drawn directly from the ESA95. The first two digits denote the sector; the third digit denotes the ESA account. In this way for example, table 5.2.1 is the central government production account, table 5.3.1 is the local government production account and table 5.3.2 is the local government generation of income account. Not all sectors can have all types of account, so the numbering is not necessarily consecutive within each sector's chapter. For the rest of the world, the identified components of accounts 2–6 inclusive are given in a single account numbered 2. The UK whole economy accounts consistent with the ESA95 are given in section 1.6 as a time series, and in section 1.7 in detailed matrix format with all sectors, the rest of the world, and the UK total identified.

The ESA95 code for each series is shown in the left-hand column. The ESA95 codes use the prefix 'S' for the classification of institutional sectors. The ESA95 classification of transactions and other flows comprises transactions in products (prefix P), distributive transactions (prefix D), transactions in financial instruments (prefix F), and other accumulation entries

(prefix K). Balancing items are classified using the prefix B. Within the financial balance sheets, financial assets/liabilities are classified using the prefix AF and non-financial assets/liabilities using the prefix AN.

What is an account? What is its purpose?

An account records and displays all of the flows and stocks for a given aspect of economic life. The sum of resources is equal to the sum of uses with a balancing item to ensure this equality. Normally the balancing item will be an economic measure which is itself of interest.

By employing a system of economic accounts we can build up accounts for different areas of the economy which highlight, for example, production, income and financial transactions. In many cases these accounts can be elaborated and set out for different institutional units and groups of units (or sectors). Usually a balancing item has to be introduced between the total resources and total uses of these units or sectors and, when summed across the whole economy, these balancing items constitute significant aggregates. Table A below provides the structure of the accounts and shows how GDP estimates are derived as the balancing items.

The integrated economic accounts

The integrated economic accounts of the UK provide an overall view of the economy. The sequence of accounts is shown in Figure 1 below. Figure 1 presents a summary view of the accounts, balancing items and main aggregates and shows how they are expressed.

The accounting structure is uniform throughout the system and applies to all units in the economy, whether they are institutional units, sub-sectors, sectors or the whole economy, though some accounts (or transactions) may not be relevant for some sectors.

The accounts are grouped into four main categories: goods and services account, current accounts, accumulation accounts and balance sheets.

The goods and services account (Account 0)

The goods and services account is a transactions account which balances total resources, from output and imports, against the uses of these resources in consumption, investment, inventories and exports. Because the resources are simply balanced with the uses, there is no balancing item. The goods and services account is discussed in detail in chapters 3 and 12 of *UK National Accounts Concepts, Sources and Methods*.⁴

Current accounts: the production accounts and the distribution of income accounts

Current accounts deal with production, distribution of income and use of income.

The production account (Account I)

The production account displays the transactions involved in the generation of income by the activity of producing goods and services. In this case the balancing item is value added (B.1). For the nation's accounts, the balancing item (the sum of value added for all industries) is, after the addition of taxes less subsidies on products, gross domestic product (GDP) at market prices or net domestic product when measured net of capital consumption. The production accounts are also shown for each institutional sector.

The production accounts are discussed in detail in Chapters 4 and 13 of *Concepts, Sources and Methods*.⁴

Distribution and use of income account (Account II)

The distribution and use of income account shows the distribution of current income (in this case value added) carried forward from the production account, and has as its balancing item saving (B.8), which is the difference between income (disposable income) and expenditure (or final consumption). There are three sub-accounts which break down the distribution of income into the primary distribution of income, the secondary distribution of income and the redistribution of income in kind.

Primary incomes are those that accrue to institutional units as a consequence of their involvement in production, or their ownership of productive assets. They include property income (from lending or renting assets) and taxes on production and imports, but exclude taxes on income or wealth, social contributions or benefits and other current transfers. The primary distribution of income shows the way these are distributed among institutional units and sectors. The primary distribution account is itself divided into two sub-accounts – the generation and the allocation of primary incomes – but the further breakdown in the ESA95 of the allocation of primary income account into an entrepreneurial income account and an allocation of other primary income account has not been adopted in the UK.

The secondary distribution of income account shows how the balance of primary incomes for an institutional unit or sector is transformed into its disposable income by the receipt and payment of current transfers (excluding social transfers in kind). A further two sub-accounts – the use of disposable income and the use of adjusted disposable income – look at the use of income for either consumption or saving. These accounts are examined in detail in Chapters 5 and 14 of *Concepts, Sources and Methods*.⁴

Aggregated across the whole economy the balance of the primary distribution of income provides national income (B.5) (which can be measured net or gross), the balance of the secondary distribution of income in kind provides national disposable income (B.6), and the balance of the use of income

accounts provides national saving (B.8). These are shown in Figure 1.

The accumulation accounts (Accounts III and IV)

The accumulation accounts cover all changes in assets, liabilities and net worth (the difference for any sector between its assets and liabilities). The accounts are structured to allow various types of change in these elements to be distinguished.

The first group of accounts covers transactions which would correspond to all changes in assets/liabilities and net worth which result from transactions for example, savings and voluntary transfers of wealth (capital transfers). These accounts are the capital account and financial account which are distinguished in order to show the balancing item net lending/borrowing (B.9).

The second group of accounts relates to changes in assets, liabilities and net worth due to other factors (for example the discovery or re-evaluation of mineral reserves, or the reclassification of a body from one sector to another). Within this second group, the other changes in assets accounts, has not been implemented in the UK except for the general government financial account (see tables 11.4–11.6).

Capital account (Account III.1)

The capital account concerns the acquisition of non-financial assets (some of which will be income creating and others which are wealth only) such as fixed assets or inventories, financed out of saving, and capital transfers involving the redistribution of wealth. Capital transfers include for example, capital grants from private corporations to public corporations (for example, private sector contributions to the extension of the Jubilee line). This account shows how saving finances investment in the economy. In addition to gross fixed capital formation and changes in inventories, it shows the redistribution of capital assets between sectors of the economy and the rest of the world. The balance on the capital account, if negative, is designated net borrowing, and measures the net amount a unit or sector is obliged to borrow from others; if positive the balance is described as net lending, the amount the UK or a sector has available to lend to others. This balance is also referred to as the financial surplus or deficit and the net aggregate for the five sectors of the economy equals net lending/borrowing from the rest of the world.

Financial account (Account III.2)

The financial account shows how net lending and borrowing are achieved by transactions in financial instruments. The net acquisitions of financial assets are shown separately from the net incurrence of liabilities. The balancing item is again net lending or borrowing.

In principle net lending or borrowing in the capital account should be identical to net lending or borrowing on the financial

1/ Most balancing items and aggregates may be calculated gross or net.

account. However in practice, because of errors and omissions, this identity is very difficult to achieve for the sectors and the economy as a whole. The difference is known as the statistical discrepancy (previously known as the balancing item).

The balance sheet (Account IV)

The second group of accounts within the accumulation accounts completes the full set of accounts in the system. These include the balance sheets and a reconciliation of the changes that have brought about the change in net worth between the beginning and the end of the accounting period.

The opening and closing balance sheets show how total holdings of assets by the UK or its sectors match total liabilities and net worth (the balancing item). In detailed presentations of the balance sheets the various types of asset and liability can be shown. Changes between the opening and closing balance sheets for each group of assets and liabilities result from transactions and other flows recorded in the accumulation accounts, or reclassifications and revaluations. Net worth equals changes in assets less changes in liabilities.

Rest of the world account (Account V)

This account covers the transactions between resident and non-resident institutional units and the related stocks of assets and liabilities. The rest of the world plays a similar role to an institutional sector and the account is written from the point of view of the rest of the world. This account is discussed in detail in chapter 24 of *Concepts, Sources and Methods*.⁴

Satellite accounts

Satellite accounts are accounts which involve areas or activities not dealt with in the central framework above, either because they add additional detail to an already complex system or because they actually conflict with the conceptual framework. The UK has begun work on a number of satellite accounts and one such – the UK environmental accounts – links environmental and economic data in order to show the interactions between the economy and the environment. Summary information from the environmental accounts is presented in part 5. More detailed information on the environmental accounts is available from the ONS website at: www.statistics.gov.uk/environmentalaccounts.

Some definitions

The text within Sections 1–3 explains the sources and methods used in the estimation of the UK economic accounts, but it is sensible to precede them with an explanation of some of the basic concepts and their ‘UK specific’ definitions, namely:

- the limits of the UK national economy: economic territory, residency and centre of economic interest
- economic activity: what production is included – the production boundary
- what price is used to value the products of economic activity
- estimation or imputation of values for non-monetary transactions
- the rest of the world: national and domestic

A full description of the accounting rules is provided in Chapter 2 of *Concepts, Sources and Methods*.⁴

The limits of the national economy: economic territory, residence and centre of economic interest

The economy of the United Kingdom is made up of institutional units (see chapter 10 of *Concepts, Sources and Methods*⁴) which have a centre of economic interest in the UK economic territory. These units are known as resident units and it is their transactions which are recorded in the UK National Accounts. The definitions of these terms are given below:

The UK economic territory is made up of:

- Great Britain and Northern Ireland (the geographic territory administered by the UK government within which persons, goods, services and capital move freely)
- any free zones, including bonded warehouses and factories under UK customs control
- the national airspace, UK territorial waters and the UK sector of the continental shelf

It excludes the offshore islands, the Channel Islands and the Isle of Man, which are not part of the United Kingdom or members of the European Union.

Within the ESA95 the definition of economic territory also includes:

- territorial enclaves in the rest of the world (for embassies, military bases, scientific stations, information or immigration offices, aid agencies, used by the British government with the formal political agreement of the governments in which these units are located)

but excludes:

- any extra territorial enclaves (that is, parts of the UK geographic territory like embassies and US military bases used by general government agencies of other countries, by the institutions of the European Union or by international organisations under treaties or by agreement)

Centre of economic interest and residency

An institutional unit has a centre of economic interest and is a resident of the UK when, from a location (for example, a dwelling, place of production or premises) within the UK economic territory, it engages and intends to continue engaging (indefinitely or for a finite period; one year or more is used as a guideline) in economic activities on a significant

scale. It follows that if a unit carries out transactions on the economic territory of several countries it has a centre of economic interest in each of them (for example, BP has an interest in many countries where it is involved in the exploration and production of oil and gas). Ownership of land and structures in the UK is enough to qualify the owner to have a centre of interest here.

Within the definition given above resident units are households, legal and social entities such as corporations and quasi corporations (for example, branches of foreign investors), non-profit institutions and government. Also included here however are so called 'notional residents'.

Travellers, cross border and seasonal workers, crews of ships and aircraft, and students studying overseas are all residents of their home countries and remain members of their households. However an individual who leaves the UK for a year or more (except students and patients receiving medical treatment) ceases to be a member of a resident household and becomes a non-resident even on home visits.

Economic activity: what production is included?

As GDP is defined as the sum of all economic activity taking place in UK territory, having defined the economic territory it is important to be clear about what is defined as economic activity. In its widest sense it could cover all activities resulting in the production of goods or services and so encompass some activities which are very difficult to measure. For example, estimates of smuggling of alcoholic drink and tobacco products, and the output, expenditure and income directly generated by that activity, have been included since the 2001 edition of the *Blue Book*.

In practice a 'production boundary' is defined, inside which are all the economic activities taken to contribute to economic performance. This economic production may be defined as activity carried out under the control of an institutional unit that uses inputs of labour or capital and goods and services to produce outputs of other goods and services. These activities range from agriculture and manufacturing through service producing activities (for example, financial services and hotels and catering) to the provision of health, education, public administration and defence; they are all activities where an output is owned and produced by an institutional unit, for which payment or other compensation has to be made to enable a change of ownership to take place. This omits purely natural processes.

The decision whether to include a particular activity within the production boundary takes into account the following:

- does the activity produce a useful output?
- is the product or activity marketable and does it have a market value?
- if the product does not have a meaningful market value can a market value be assigned (that is, can a value be imputed)?
- would exclusion (or inclusion) of the product of the activity make comparisons between countries or over time more meaningful?

In practice the ESA95 production boundary can be summarised as follows:

The production of all goods whether supplied to other units or retained by the producer for own final consumption or gross capital formation, and services only in so far as they are exchanged in the market and/or generate income for other economic units.

For households this has the result of including the production of goods on own-account, for example the produce of farms consumed by the farmer's own household (however, in practice produce from gardens or allotments has proved impossible to estimate in the United Kingdom so far). The boundary excludes the production of services for own final consumption (household domestic and personal services like cleaning, cooking, ironing and the care of children and the sick or infirm). Although the production of these services does take considerable time and effort, the activities are self-contained with limited repercussions for the rest of the economy and, as the vast majority of household domestic and personal services are not produced for the market, it is very difficult to value the services in a meaningful way.

What price is used to value the products of economic activity?

In the UK a number of different prices may be used to value inputs, outputs and purchases. The prices are different depending on the perception of the bodies engaged in the transaction, that is, the producer and user of a product will usually perceive the value of the product differently, with the result that the output prices received by producers can be distinguished from the prices paid by purchasers.

These different prices – purchasers' (or market) prices, basic prices and producers' prices – are looked at in turn below. They differ as a result of the treatment of taxes less subsidies on products, and trade and transport margins. Although the factor cost valuation (see explanation in Part 1) is not required under the SNA93 or the ESA95, ONS will continue to provide figures for gross value added at factor cost for as long as customers continue to find this analysis useful.

Basic prices

These prices are the preferred method of valuing output in the accounts. They reflect the amount received by the producer for a unit of goods or services, minus any taxes payable, and plus any subsidy receivable on that unit as a consequence of production or sale (that is, the cost of production including

subsidies). As a result the only taxes included in the price will be taxes on the output process – for example business rates and vehicle excise duty – which are not specifically levied on the production of a unit of output. Basic prices exclude any transport charges invoiced separately by the producer. When a valuation at basic prices is not feasible then producers' prices may be used.

Producers' prices

Producers' prices equal basic prices plus those taxes paid per unit of output (other than taxes deductible by the purchaser, such as VAT, invoiced for output sold) less any subsidies received per unit of output.

Purchasers' or Market prices

These are the prices paid by the purchaser and include transport costs, trade margins and taxes (unless the taxes are deductible by the purchaser).

Purchasers' prices equal producers' prices plus any non-deductible VAT or similar tax payable by the purchaser, plus transport costs paid separately by the purchaser and not included in the producers' price.

'Purchaser's prices' are also referred to as 'market prices', for example 'GDP at market prices'.

The rest of the world: national and domestic

Domestic product (or income) includes production (or primary incomes generated and distributed) resulting from all activities taking place 'at home' or in the UK domestic territory. This will include production by any foreign owned company in the United Kingdom but exclude any income earned by UK residents from production taking place outside the domestic territory. Thus gross domestic product is also equal to the sum of primary incomes distributed by resident producer units.

The definition of gross national income can be introduced by considering the primary incomes distributed by the resident producer units above. These primary incomes, generated in the production activity of resident producer units, are distributed mostly to other residents' institutional units. For example, when a resident producer unit is owned by a foreign company, some of the primary incomes generated by the producer unit are likely to be paid abroad. Similarly, some primary incomes generated in the rest of the world may go to resident units. Thus, when looking at the income of the nation, it is necessary to exclude that part of resident producers' primary income paid abroad, but include the primary incomes generated abroad but paid to resident units; that is:

Gross domestic product (or income)

less

primary incomes payable to non-resident units

plus

primary incomes receivable from the rest of the world

equals

Gross national income

Thus gross national income (GNI) at market prices is the sum of gross primary incomes receivable by resident institutional units/ sectors.

National income includes income earned by residents of the national territory, remitted (or deemed to be remitted in the case of direct investment) to the national territory, no matter where the income is earned; that is:

Real GDP (chained volume measures)

plus

trading gain

equals

Real gross domestic income (RGDI)

Real gross domestic income (RGDI)

plus

real primary incomes receivable from abroad

less

real primary incomes payable abroad

equals

Real gross national income (real GNI)

Real GNI (chained volume measures)

plus

real current transfers from abroad

less

real current transfers abroad

equals

Real gross national disposable income (real GNDI)

Receivables and transfers of primary incomes, and transfers to and from abroad are deflated using the index of gross domestic final expenditure.

Gross domestic product: the concept of net and gross

The term gross refers to the fact that when measuring domestic production we have not allowed for an important phenomenon: capital consumption or depreciation. Capital

goods are different from the materials and fuels used up in the production process because they are not used up in the period of account but are instrumental in allowing that process to take place. However over time, capital goods wear out or become obsolete and in this sense gross domestic product does not give a true picture of value added in the economy. In other words, in calculating value added as the difference between output and costs we should include as a current cost that part of the capital goods used up in the production process; that is, the depreciation of the capital assets.

Net concepts are net of this capital depreciation, for example:

Gross domestic product

minus

consumption of fixed capital

equals

Net domestic product

However, because of the difficulties in obtaining reliable estimates of the consumption of fixed capital (depreciation), gross domestic product remains the most widely used measure of economic activity.

Symbols and conventions used

Symbols

In general, the following symbols are used:

.. not available

– nil or less than £500,000

£ billion denotes £1,000 million.

Calendar of economic events: 1980–2009

1980

- Jan Steel strike begins
- Mar Medium Term Financial Strategy announced
- Jun Britain becomes a net exporter of oil
Agreement to reduce UK's budget contribution to European Community (EC)
- Oct Dollar exchange rate peaks at \$2.39 per £
- Nov Ronald Reagan elected US President

1981

- Jan Bottom of worst post-war slump in Britain
- Feb The Times sold to Rupert Murdoch
- Mar Budget announces windfall tax on banks
- Jul Cuts in university spending announced
- Aug Minimum Lending Rate (MLR) suspended

1982

- Feb Laker Airlines collapses
- Apr British naval task force sent to Falklands
- Jun Ceasefire in Falklands
- Jul Hire purchase controls abolished
- Aug Barclays Bank starts opening on Saturdays
- Sep Unemployment reaches three million
- Nov Channel 4 Television begins transmission

1983

- Jun £450m EC budget rebate granted to UK
Conservatives re-elected at general election
- Jul £500m public spending cuts announced
- Sep 3% target set for public sector pay
- Oct European Parliament freezes budget rebate

1984

- Mar Miners' strike begins
- Jun Robert Maxwell buys Daily Mirror
- Jun Fontainebleau Summit agrees permanent settlement of UK's contribution to EC
- Oct Bank of England rescues Johnson Matthey

- Nov British Telecom plc privatised
Ronald Reagan re-elected US President

- Dec Agreement to hand over Hong Kong to China in 1997

1985

- Jan FT Index reaches 1,000 for the first time
- Mar End of year long miners' strike
Dollar exchange rate bottoms out at \$1.05/£
- Dec NatWest, Barclays and Lloyds Banks announce 'free banking'

1986

- Jan Michael Heseltine resigns from Government over Westland Helicopters affair
- Feb Single European Act signed
- Mar Budget cuts basic rate of income tax to 29% and introduces Personal Equity Plans (PEPs)
Greater London Council abolished
- Apr Chernobyl nuclear reactor disaster
Bus services deregulated
The Independent newspaper founded
- Nov 'Big Bang' deregulates dealing in the City
- Dec British Gas privatisation

1987

- Jan Prosecutions for insider dealing in Guinness case
British Airways privatisation
- Mar Budget reduces basic rate of tax to 27%
- Jun Conservatives re-elected at general election
- Oct 'Hurricane' strikes Britain
'Black Monday' collapse of stock market

1988

- Mar Budget reduces basic rate of tax to 25%; top rate to 40%
British Leyland sold to BMW
- Jun Barlow-Clowes collapses
- Jul Piper Alpha oil rig disaster
- Sep Worst ever UK trade deficit announced

Nov George Bush elected US President

Dec Salmonella outbreak in Britain

1989

Mar Exxon Valdez oil spillage disaster in Alaska

Apr Chinese authorities quell dissidents in Tiananmen Square

Jul Blue Arrow report from Department of Trade and Industry

Oct Nigel Lawson resigns as Chancellor

Nov Ford takes over Jaguar

Fall of Berlin Wall

1990

Mar Budget introduces tax exempt savings accounts (TESSAs)

Apr BSE ('Mad cow disease') identified
New Education Act brings in student loans
Community Charge ('Poll Tax') introduced

Aug Kuwait invaded by Iraq

Oct Official reunification of Germany
UK enters Exchange Rate Mechanism

Nov John Major replaces Margaret Thatcher as Prime Minister
Privatisation of electricity boards

1991

Jan NHS internal market created
Gulf War begins

Feb Gulf War ends

Mar Air Europe collapses
Budget restricts mortgage interest relief to basic rate:
Corporation Tax reduced and Value Added Tax (VAT)
increased

Jul Bank of Credit and Commerce International closed by
Bank of England

Nov Maastricht agreement signed with UK opt-outs

Dec Mikhail Gorbachev replaced by Boris Yeltsin as President
of the Soviet Union

1992

Jan Russia agrees to join the International Monetary Fund
(IMF)

Feb 'Delors Package' raises EC's spending limits to 1.37% of
GDP to aid poorer member states

Mar Budget raises lower rate of income tax to 20%

Midland Bank agrees merger with Hong Kong and
Shanghai Bank

Apr Conservatives re-elected at general election

May Swiss vote in a referendum to join the IMF and
International Bank for Reconstruction and Development
Reform of EC Common Agricultural Policy agreed,
switching from farm price support to income support

Sep 'Black Wednesday' – UK leaves Exchange Rate
Mechanism

Oct North American Free Trade Agreement (NAFTA) signed

Nov Bill Clinton elected US President

Dec Plan for National Lottery announced

1993

Jan Council Tax announced as replacement for Community
Charge
University status given to polytechnics

Mar Budget imposes VAT on domestic fuel

Nov Parliament votes to relax Sunday trading rules
First autumn budget cuts public expenditure and
increases taxes

Dec Uruguay Round of tariff reductions approved

1994

Jan European Economic Area formed linking EU and
European Free Trade Area

Apr Eurotunnel opens

Aug IRA ceasefire begins

Oct Brent Walker leisure group collapses

Nov First draw of National Lottery

Dec Coal industry privatised

1995

Jan EU expanded to include Sweden, Finland and Austria
World Trade Organisation succeeds General Agreement
on Tariffs and Trade

Feb Barings Bank collapses

Sep Net Book Agreement suspended

1996

Jan Gilt 'repo' market established

Mar Rebates worth £1 billion paid to electricity consumers
after break up of National Grid

May Railtrack privatised, reducing public service borrowing requirement by £1.1 billion

Aug CREST clearing system initiated

Sep Privatisation of National Power and PowerGen reduces PSBR by further £1.0 billion

Nov Bill Clinton re-elected US President

1997

Apr Alliance & Leicester Building Society converts to bank

May Labour wins General Election

Chancellor announces operational independence for the Bank of England; decisions on interest rates to be taken by a new Monetary Policy Committee

Jun Halifax Building Society converts to a bank

Norwich Union floated on the stock market

Jul Gordon Brown presents his first Budget, setting inflation target of 2.5%

Woolwich Building Society converts to a bank

Bristol and West Building Society converts to a bank

Aug Stock market falls in Far East, Hang Seng Index ending 20% lower than a year earlier

Economic and financial crisis in Russia

Dec The first instalment of the windfall tax on utilities (£2.6 billion) is paid

1998

Apr Sterling Exchange Rate Index hits its highest point since 1989

Mortgage payments rise as Mortgage Interest Relief at Source (MIRAS) is cut from 15% to 10%

The New Deal for the unemployed is introduced

Jun The Bank of England's 'repo' rate is raised by 0.25% to a peak of 7.5%

Economic and Fiscal Strategy Report announces new format for public finances, distinguishing between current and capital spending

Aug BP merges with Amoco to create the UK's largest company

Oct The Working Time Directive, setting a 48-hour week, takes effect

Dec The second instalment of the windfall tax on utilities (£2.6 billion) is paid

Ten of the eleven countries about to enter the euro harmonise interest rates at 3.0%

1999

Jan Introduction of euro currency

Mar Allocation of new car registration letters switched from yearly in August to twice yearly

Budget – energy tax announced

Apr Introduction of Individual Saving Accounts (ISAs) replace PEPs and TESSAs

Introduction of national minimum wage

Advanced Corporation tax abolished

Jun The Bank of England 'repo' rate reduced to low point of 5%

Nov Jubilee Line Underground extension completed

Dec Pre-budget statement

Year 2000 preparations (Y2K)

2000

Jan Confounding expectations, the millennium passed without any major Y2K related problems

Feb House price growth peaks at 15% in January and February

Oil price rises to highest level in ten years

The UK company Vodafone takes over the German company Mannesman for £113bn

Apr Government announces issue of 3G mobile phone spectrum licenses

May Share prices in so-called internet companies start falling

Competition commission finds that UK car prices high relative to EU prices

BMW sells Rover and Ford shuts Dagenham plant

Jun Inward investment in the UK hits record levels, with a large proportion made up of take-over deals

Jul Hauliers and farmers stage large scale protests over the price of fuel

Aug European banking regulators investigate £117bn of new loans made to telecommunications companies, reflecting concerns that banks have overlent to the sector

Nov George W Bush elected US President

Dec US GDP growth slows sharply, following prolonged expansion

2001

Jan The Federal Reserve cuts interest rates twice in one month, by 0.5% each time

- Feb** The FTSE share price index falls below the symbolic 6,000 points mark
- Apr** It emerges that Japan's bad debt problems are even worse than feared
- May** In the UK, business insolvencies are at a six year high
- Jun** Pharmaceutical company Glaxo sheds 18,000 staff, 7% of its UK workforce
Labour re-elected at general election
- Sep** Terrorist attacks in United States. The World Trade Centre in New York is destroyed
- Oct** The US attacks Afghanistan
Argentina devalues its currency and defaults on its debt of \$155 billion, the biggest default in history
Railtrack collapses after the Government refuses to give further subsidies
- Nov** Bank of England cuts interest rates from 4.5% to 4.0%
- Dec** In the third quarter of 2001, US GDP shrinks for the first time in eight years
Enron, the 8th largest company in the United States, collapses leading to concerns about accountancy practices, banking involvement and financial market regulation

2002

- Jan** Euro notes and coins enter circulation
- Apr** UK tax rises announced to fund NHS
- Jun** WorldCom collapses – the biggest corporate failure in history
Network Rail take over running of the railway infrastructure
- Aug** IMF announced a \$30 billion loan for Brazil, its biggest ever bailout of a struggling economy
- Oct** UK housing boom peaks as house price inflation reaches 30%
- Nov** US Federal Reserve cuts rate to 1.25%, a 40 year low in reaction to fears that the economy is running out of steam
Slowing UK economy forces doubling of the estimate of public borrowing
- Dec** ECB cuts interest rates for the first time in more than a year, from 2.75% to 2.5%
Stock markets around the world fall sharply over the second half of the year, with the FTSE100 dropping below 4,000

2003

- Jan** Sweden pushes back its preferred date of euro entry from early 2005 to 2006
The FTSE 100 drops by nearly 50% since its peak in 1999, reaching its lowest level since 1995
UK economic growth at its lowest level since 1992, at 1.8% per annum
UK manufacturing jobs fall to their lowest level since records began
- Feb** UK interest rates reduced by 0.25% to 3.75% due to weak internal and external demand
- Mar** Iraq war begins
- Jul** UK interest rates reduced by 0.25% to 3.5%, its nadir since May 1954, due to weak demand
- Nov** UK interest rates raised by 0.25% to 3.75%

2004

- Feb** UK interest rates raised by 0.25% to 4.0%
- May** UK Interest rates rise 0.25% to 4.25%
Price of oil breaches \$40 barrier
Petrol prices reach 80p a litre
- Jun** Federal Reserve of US raises interest rates by 0.25% to 1.25%
UK interest rates rise 0.25% to 4.5%
- Jul** Atkinson Review of government output measurement published
- Aug** Bank of England raises interest rates 0.25% to 4.75%
- Nov** George W Bush re-elected US president

2005

- Jan** Sir Tony Atkinson presents his report on the 'Measurement of government output and productivity in the National Accounts'
- Mar** Federal Reserve Committee raises interest rates by 0.25% to 2.75%
- May** Labour re-elected at general election
- Jun** Oil reaches near \$60 a barrel due to proposed strike in Norway
- Jul** G8 Summit in Gleneagles
UK wins right to host Olympics in 2012
- Aug** Bank of England cuts interest rates by 0.25% to 4.5%
Hurricane Katrina hits the US
US crude oil prices breach \$70 a barrel

Oct UK house price inflation hits nine year low of 2.2% in October according to the Office of the Deputy Prime Minister

Dec European Central Bank (ECB) raises interest rates by 0.25% to 2.5%

Federal Reserve raises interest rates for the 13th consecutive time by 0.25% to 4.25%

2006

Jan Ukraine/Russia gas dispute leads to cuts in gas supplies to Europe

Federal Reserve raises interest rates by 0.25% to 4.50%

Mar ECB raises interest rates by 0.25% to 2.5%

FTSE breaks 6,000 barrier

Federal Reserve raises interest rates by 0.25% to 4.75%

May Federal Reserve raises interest rates by 0.25% to 5.00%

Oil prices rise above \$73 a barrel

State pension age to rise to 68 from 2044

Jun Oil reaches \$74 a barrel in response Iran nuclear dispute

ECB raises interest rates by 0.25% to 2.75%

Federal Reserve raises interest rates by 0.25% to 5.25%

Jul Israel–Lebanon conflict pushes barrel of oil to \$78 a barrel

Japan's Central Bank raises interest rate from 0.0% to 0.25% – the first increase in six years

G8 summit held in Russia

Aug Bank of England raises Interest rates by 0.25% to 4.75%

ECB raises interest rates by 0.25% to 3.00%

Sep At \$64.55, oil prices fall to their lowest level since the end of March

Greece announces 25 per cent increase in annual GDP after a new GDP calculation is applied

Oct ECB lifts repo rate by 25 basis points to 3.25%

World output increases by 5.2% in the year to the second quarter

Nov Bank of England raises interest rates by 0.25% to 5.00%

Dec The pound surges against the dollar – sterling is at its highest level since Black Wednesday

ECB raise interest rates by 25 basis points to 3.5%

OPEC agrees to cut oil production from 1 February 2007

2007

Jan Bank of England raises interest rates by 0.25% to 5.25%

The euro displaces the US dollar as the world's leading currency in international bond markets

Feb FTSE 100 hits a six-year high after a flurry of takeover speculation

Mar ECB lifts repo rate by 25 basis points to 3.75%

Apr Sterling moves past the \$2 mark for the first time since 1992

May Bank of England raises interest rates by 0.25% to 5.5%

Jun Gordon Brown replaces Tony Blair as Prime Minister

Aug The financial crisis begins with Central banks intervening on a large scale as banks around the world stopped lending to each other

Sep Oil hits a new record high of \$93.80

Sterling rises to a 26 year high of \$2.0694 against the dollar

Nov Crude oil futures hit a record closing high, finishing above \$98 a barrel

The three-month interbank interest rate hit 6.59 per cent

UK house prices record their biggest fall in 12 years

Dec Bank of England cuts interest rates by 0.25% to 5.5%

The Federal Reserve cut interest rates by 0.25% to 4.25%

2008

Jan Gold prices surge above \$900 a troy ounce for the first time ever as investors seek refuge from a weakening US dollar

Stock markets in London and Europe suffer their biggest one-day falls since 11 September 2001

Oils hit a new record high of \$100 a barrel

Federal Reserve cut interest rates to 3%

Feb Bank of England cuts the rate of interest by 0.25% to 5.5%

Alistair Darling announces the nationalisation of Northern Rock

Oil hits a new record high of \$101

Mar US dollar falls to a record low as the euro moves to above \$1.56

The pound drops to a record low of £0.79 against the euro

Federal Reserve cut interest rates by 75 basis points to 2.25 per cent

Apr Oil hits a new record high above \$122 a barrel

Bank of England cuts interest rates by 0.25% to 5%

- May** Oil hits a new record high of \$124 per barrel
- Jun** Oil hits a new record high of \$140.39 per barrel
- Jul** ECB increases eurozone rates to seven year high (up to 4.25%)
- Aug** Oil prices fall below \$120 for the first time in three months as fears on world growth intensify
- Sep** Biggest worldwide stockmarket crash since 1929
Lehman Brothers file for chapter 11 bankruptcy protection; the largest such filing in US history. Barclays purchase their US assets and Nomura takes over their UK operations
AIG credit rating downgraded below AA level and Federal Reserve grants \$85bn credit facility to enable fulfilment of collateral obligations
Goldman Sachs and Morgan Stanley give up investment banking status
Lloyds TSB takes over HBOS
Oil prices drop below \$90 a barrel
- Oct** Further significant falls in stock values worldwide
US government agrees \$700bn bank bail-out package
UK government agrees £50bn recapitalisation and £200bn of loans to banking sector
Chancellor raises UK bank deposit guarantee to £50,000
Landsbanki nationalised by Icelandic government after collapse. All accounts frozen. Government guarantees UK retail accounts holdings
- Nov** Interest rates fall to a 54 year low. The Bank of England cuts base rates by 1.5% to 3%
ECB cuts rates by 0.5% to 3.25%
Barack Obama elected US President
- Dec** Bank of England announces a rate cut to 2%, the joint lowest for Bank Rate not matched since 1951
ECB cuts interest rates by 75 basis points to 2.5%
- 2009**
- Jan** Rates fall to a 315 year low. Bank of England cuts interest rates to 1.5%
ECB cuts interest rates by 50 basis points to 2%
- Feb** US Congress and Obama administration reach a deal on a \$789bn economic stimulus package
European leaders outline sweeping proposals to regulate financial markets and hedge funds and clamp down on tax havens
- Bank of England cuts the rate of interest to 1.0%
- Mar** Share prices tumble across the globe amid mounting fears over the financial health of banks and a spate of dividend cuts. Wall Street hits lowest levels since 1997
AIG reveals the depth of its financial plight with a \$61.7bn quarterly loss
The EC unveil new regulatory and legislative measures designed to beef up supervision of Europe's financial institutions
Bank of England introduce quantitative easing, £75bn to pump into the economy over the next three months
ECB cuts interest rates by 50 basis points to 1.5%
The IMF will have its \$250bn resources doubled to fight the financial crisis in emerging markets
Bank of England cuts the rate of interest to 0.5%
- Apr** G20 leaders unveil a \$1,100bn package of measures to tackle global downturn
Nine building societies including Nationwide, have been downgraded by Moody's amid concern about their exposure to falling house prices and specialist mortgage loan
- May** Bank of England boosts its quantitative easing program by announcing the availability of a further £50bn in Bank money
ECB cuts its main target rate by a quarter per cent to 1% and announced plans to purchase £54bn in covered bonds
Car Scrappage scheme gets off to a faltering start as confusion over operational practicalities causes some manufacturers to delay their involvement in the process
Standard & Poor raises the possibility of a ratings downgrade to UK sovereign debt over fears of spiralling government indebtedness, lowering medium-term outlook to 'negative'
Oil surges to \$63 a barrel, with OPEC indicating that the global economy can withstand prices of between \$75 and \$80 a barrel
- Jun** General Motors file for Chapter 11 bankruptcy protection
Ireland's credit rating cut to double A, with a negative outlook, from double A plus
Lloyds banking group to repay £2.3bn to the Treasury, aimed at repaying the government's \$4bn of preference shares

- Bank of England announces that it will extend its Asset Purchase Facility to forms of working capital
- ECB lends €442bn to banks in bid to unlock credit markets
- Jul** Spanish bank Santander announces plans to strengthen its balance sheets and improve its capital structure by offering to swap a nominal €9.1bn (£7.8bn) in 30 securities for two new issues
- Oil price drops below \$60 per barrel for the first time since mid-May as markets continued to react to latest US inventories data
- McDonald's to leave London for Geneva, joining other US groups moving European headquarters to take advantage of preferential intellectual property tax laws
- The pay and bonuses of hundreds of high-flying City traders and dealmakers to be publicly disclosed under a Treasury-backed plan to curb excessive and risky remuneration
- Nissan to build a plant in the UK to make Lithium-ion batteries for electrical vehicles in one of the biggest new investments by a carmaker since the industry entered its downturn last year
- Aug** Oil surges to \$73.50 a barrel as commodities prices hit their highest level for the year
- Bank of England boosts its quantitative easing program to £175bn
- Sep** World Trade Organisation give Brazil the green light to impose \$295m (£181m) of sanctions on US goods over Washington's failure to scrap illegal subsidies to its cotton farmers
- BP, the UK energy group, discovers a 'giant' oil field in the Gulf of Mexico that shows a new frontier opening up for US oil production
- Gold prices hit a six month high, approaching the \$1,000 a Troy ounce mark for the fifth time in two years, as wary investors pull back from equities
- Dutch bankers are poised to become the first in the world to cap bonuses paid to their most senior executives under a new code restricting such pay-outs to the equivalent of a year's salary
- Moody's forecast further losses of £130bn for UK banks over the next few years as bad debts rise and pressure builds on profitability
- Billions of dollars' worth of the complex securities at the heart of the financial crisis to be liquidated, enabling banks, insurance companies and other investors to clear toxic assets from their books
- Oct** Aviva to sell their stake in Dutch subsidiary Delta Lloyd, the biggest initial public offering in Europe for at least 18 months
- Russia to launch its first international bond in a decade to bolster its public finances and take advantage of the surge in demand for emerging market debt
- Oil prices face further upward pressure as they near \$80 a barrel because of heavy trading in options contracts ahead of the year end
- Nov** Gold prices surge to an all time high after India buys 200 tonnes of the precious metal, a strong sign that Asian countries are moving away from the US currency
- Government gives £37bn of new bail out cash to RBS and Lloyds
- Bank of England Monetary Policy Committee slows the rate of its asset purchase injections into the UK economy, taken as a signal of some improvement in macroeconomy and a potential sign of the end of loosening of monetary policy
- Dubai World, a sovereign backed holding group, requests a delay on repayment of its liabilities (around \$60bn); news sends negative shock waves through world stock markets and a significant jump in the dollar
- KPMG business outlook reports further entrenchment of global recovery, being led by the USA and the BRIC economies, most notably Brazil. The recovery could be less marked in Europe and Japan
- Dec** Greece faces possible ratings downgrade
- Chancellor releases the Pre-Budget Report 2009
- Gold prices fall for a fourth session and commodity markets remain under pressure as risk appetite weakened
- Greece's bond markets see the most spectacular collapse in the history of the eurozone as investors decide the country's public finances may be beyond repair
- Standard & Poor' turn pessimistic on the Spanish economy, changing Spain outlook from 'stable' to 'negative'
- OPEC indicate that it aims to keep oil prices at \$70–\$80 per barrel next year as it tries to support the economic recovery
- Bank of England's injection of cash into the economy has so far fallen short of the desired result, according to the monetary policy committee
- Iceland's parliament approves an amended bill to repay more than \$5bn lost by savers in Britain and the Netherlands when the island's banks collapsed during the financial crisis

An aerial, high-angle photograph of a large, open public space, likely a plaza or square, filled with many people walking. The image is heavily blurred and has a light blue color overlay. The people are seen from above, moving in various directions. In the background, there are some architectural elements like railings and what might be a staircase or a set of stairs.

Main aggregates and summary accounts

Part 1

Chapter 1

National Accounts at a glance

Gross domestic product

In 2009 the output of the economy, as measured by the chained volume measure of **gross domestic product** (GDP), was 4.9 per cent lower than in 2008, compared with a fall of 0.1 per cent in 2008 over 2007. The chained volume measure of GDP rose by 46.9 per cent between 1989 and 2009.

Money GDP (at current market prices) fell by 3.7 per cent between 2009 and 2008, compared to a 2.9 per cent increase in 2008 over 2007. Since 1989, money GDP has grown by a factor of 2.7.

Gross domestic product deflator

This graph shows changes in the implied GDP deflator based on expenditure at market prices.

The annual rate of growth in the GDP expenditure deflator is 1.3 per cent in 2009 over 2008. This is the sixth consecutive year where growth of the GDP deflator has remained below 3.0 per cent.

Annual changes GDP chained volume measures

Annual changes in the GDP market prices deflator

GDP: contribution of expenditure components to growth in 2009

The fall in real GDP of 4.9 per cent in 2009 can be split amongst the various expenditure components. This table shows what effect the change in each component would have had if all other components had remained unchanged. The fall in gross fixed capital formation expenditure has been the strongest influence on negative growth. In contrast, net exports showed a positive influence on growth.

Contributions to annual growth in the chained volume measure of GDP, 2009

Component	Change in GDP	
	£ million	Percentages
Household and NPISH final expenditure	-29,121	-2.1
General government final expenditure	3,631	0.3
GFCF	-34,928	-2.6
Changes in inventories	-15,541	-1.1
Net exports	11,518	0.8
Other ¹	-2,308	-0.2
Total	-66,749	-4.9

¹ Comprises acquisition of valuables and the statistical discrepancy between the expenditure measure and the average measure of GDP

Gross final expenditure at current prices: share by category of expenditure

Gross final expenditure (GFE) measures the sum of final uses of goods and services produced by, or imported to, the UK. In 2009 half of the total GFE was attributed to households and NPISH final consumption (50 per cent). Exports of goods and services accounted for around 21 per cent and the remainder was split between general government consumption (18 per cent) and gross capital formation (11 per cent).

GFE at current prices: share by category of expenditure

Per cent

GDP at current prices: share by category of income

The income approach to GDP measures the income earned by individuals and corporations in the production of goods and services. In 2009 over half (55 per cent) of GDP at current market prices was accounted for by compensation of employees, which is largely comprised of wages and salaries. Total operating surplus, which includes corporations' gross trading profits accounted for just over a fifth (22 per cent). Taxes and subsidies on production and imports, included to convert the estimate to market prices, accounted for 11 per cent of the remainder.

GDP at current market prices: share by category of income

Per cent

Gross value added at basic prices, by industry

In 2009 compared to 2008, the output of the production sector fell by 10.2 per cent, while the service sector fell by 3.3 per cent. The output of the agriculture, hunting, forestry and fishing sector fell by 4.9 per cent.

GVA at basic prices, by industry

Index 2006=100

Gross value added at basic prices, by industry, 2006

In 2006, the latest base year, just over 75 per cent of total gross value added was from the services sector, compared to 17 per cent from the production sector. Most of the remainder was attributed to the construction sector.

Gross value added at basic prices, by industry, 2006

Per cent

GDP per head

GDP chained volume measures per head fell by 5.5 per cent in 2009 compared to a fall of 0.7 per cent in 2008.

GDP per head

Percentage change

GDP and real household disposable income

Real household disposable income (RHDI) is the total resources available to the households sector after deductions. RHDI rose by 1.8 per cent in 2009, while the chained volume measure of GDP fell by 4.9 per cent.

Comparison of GDP and real household disposable income

Index 2006=100

Main aggregates and summary accounts

UK GDP and national income (Tables 1.1, 1.2, 1.3, 1.4)

Gross domestic product at current prices

The three approaches and the need for balancing

Gross Domestic Product (GDP) is arguably the most important aggregate or summary indicator for purposes of economic analysis and comparisons over time. It measures total domestic activity and can be defined in three different ways:

- GDP is the sum of gross value added of the institutional sectors or the industries *plus* taxes and *less* subsidies on products (which are not allocated to sectors and industries). It is also the balancing item in the total economy production account
- GDP is the sum of final uses of goods and services by resident institutional units (actual final consumption and gross capital formation), *plus* exports and *less* imports of goods and services
- GDP is the sum of uses in the total economy generation of income account (compensation of employees, taxes on production and imports *less* subsidies, gross operating surplus and gross mixed income of the total economy)

This is also the basis of estimating GDP. The use of three different methods which, as far as possible, use independent sources of information avoids sole reliance on one source and allows greater confidence in the overall estimation process.

The resulting estimates however, like all statistical estimates, contain errors and omissions; we obtain the best estimate of GDP (that is, the published figure) by reconciling the estimates obtained from all three approaches. On an annual basis this reconciliation is carried out through the construction of the Input-Output Supply and Use Tables for the years for which data are available, and for subsequent periods by carrying forward the level of GDP set by the annual balancing process by using the quarterly movements in production, income and expenditure indicators.

For years in which no input-output balance has been struck a statistical discrepancy exists between estimates of the total expenditure components of GDP and the total income components of GDP after the balancing process has been carried out. This statistical discrepancy is made up of two components which are shown in the accounts, namely:

- the statistical discrepancy (expenditure adjustment), which is the difference between the sum of the expenditure components and the definitive estimate of GDP, plus
- the statistical discrepancy (income adjustment), which is the difference between the sum of the income components and the definitive estimate of GDP (with sign reversed)

As outlined in the framework above, the different approaches to the measurement of GDP provide various breakdowns useful for a wide range of economic analyses. These approaches are described in more detail below.

The income approach

The income approach provides estimates of GDP and its 'income' component parts at current market prices. The sources and methods of this approach are described in detail in Chapter 14 of *Concepts, Sources and Methods*.²

As it suggests, the income approach adds up all income earned by resident individuals or corporations in the production of goods and services and is therefore the sum of uses in the generation of income account for the total economy (or alternatively the sum of primary incomes distributed by resident producer units).

However some types of income are not included – these are transfer payments like unemployment benefit, child benefit or state pensions. Although they do provide individuals with money to spend, the payments are made out of, for example, taxes and national insurance contributions. Transfer payments are a **redistribution** of existing incomes and do not themselves represent any addition to current economic activity. To avoid double counting, these transfer payments and other current transfers (for example, taxes on income and wealth) are excluded from the calculation of GDP although they are recorded in the secondary distribution of income account.

In the UK the income measure of GDP is obtained by summing together:

- gross operating surplus
- gross mixed income
- compensation of employees (wages and salaries and employers' social contributions)
- taxes on production and imports
less any subsidies on production

Mixed income is effectively the operating surplus of unincorporated enterprises owned by households, which implicitly includes remuneration for work done by the owner or other members of the household. This remuneration cannot be identified separately from the return to the owner as entrepreneur.

As most of these incomes are subject to tax, the figures are usually obtained from data collected for tax purposes by HM Revenue & Customs. However, because there is some delay in providing good quality estimates by this method, other sources are used to provide initial estimates.

The operating surplus and mixed income are measures of profit that exclude any holding gains. (Holding gains result when, although no new goods or services have been produced, the value of inventories and fixed assets has increased simply as the result of an increase in the price of the item.)

The Office for National Statistics (ONS) aims to cover the UK economy as comprehensively as possible. It is recognised that some income is not declared to the tax authorities, and to allow for this adjustments are routinely made to the GDP income measure. In 2007 the adjustment for undeclared income was about £23.2 billion, approximately 1.7 per cent of GDP.

Although the income approach cannot be used to calculate chained volume measures directly (because it is not possible to separate income components into prices and quantities in the same way as for goods and services) some estimates are obtained indirectly. The expenditure-based **GDP deflator at market prices** (also known as the **index of total home costs**) is used to deflate the current market price estimates to provide a chained volume measure of the total income component of GDP for balancing purposes.

Data on the income components can be found in Table 1.2.

The expenditure approach

The expenditure approach measures total expenditure on finished or final goods and services produced in the domestic economy or, alternatively, the sum of final uses of goods and services by resident institutional units **less** the value of imports of goods and services.

The total is obtained from the sum of final consumption expenditure by households, non-profit institutions serving households and government on goods and services, gross capital formation (capital expenditure on tangible and intangible fixed assets, changes in inventories and acquisitions **less** disposals of valuables) and net exports of goods and services.

This approach can be represented by the following equation:

$$\text{GDP} = C + G + I + X - M$$

Where: C = final consumption expenditure by households and NPISH sectors,

G = government consumption expenditure,

I = investment or gross capital formation,

X = exports and M = imports.

The data for these categories are estimated from a wide variety of sources including expenditure surveys, the government's internal accounting system, surveys of traders and the administrative documents used in the importing and exporting of some goods.

To avoid double counting, in this approach it is important to classify consumption expenditures as either final or intermediate. **Final consumption** involves the consumption of goods purchased by or for the ultimate consumer or user. These expenditures are final because the goods are no longer part of the economic flow or being traded in the market place. **Intermediate consumption** on the other hand is consumption of goods and services which are used or consumed in the production process. Gross capital formation is treated separately from intermediate expenditure as the goods involved are not used up within the production process in an accounting period.

Exports include all sales to non-residents, and exports of both goods and services have to be regarded as final consumption expenditure, since they are final as far as the UK economy is concerned.

Imports of goods and services are deducted because although they are included directly or indirectly in final consumption expenditure they are not part of domestic production. What remains is what has been produced in the UK – gross domestic product using the expenditure approach.

Data on the current price expenditure components can be found in Table 1.2.

As well as GDP at current prices, the expenditure approach is used to estimate chained volume measures of GDP. The chained volume measure shows the change in GDP **after** the effects of inflation have been removed (see 'UK GDP Chained Volume Measures' below).

GDP at market prices (£ million)

	Current prices	Chained volume measures
1995	733,266	964,780
1996	781,726	992,617
1997	830,094	1,025,447
1998	879,102	1,062,433
1999	928,730	1,099,327
2000	976,533	1,142,372
2001	1,021,828	1,170,489
2002	1,075,564	1,195,035
2003	1,139,746	1,228,595
2004	1,202,956	1,264,852
2005	1,254,058	1,292,335
2006	1,328,363	1,328,363
2007	1,404,845	1,364,029
2008	1,445,580	1,363,139
2009	1,392,705	1,296,390

The reference year for the chained volume measure series in this edition of the *Blue Book* is 2006; the chained volume measure of GDP for 2006 is referenced to, and therefore equal to, the annual current price estimate of GDP for 2006.

Two methods are used to remove the effects of inflation to obtain these chained volume measures. For some series, price indices for particular goods and services – such as components of the retail prices index (RPI) or the producer price index (PPI) – are used to ‘deflate’ the current price series. For other series, chained volume measures are assumed to be proportional to the volume of goods or services. Chained volume measures of GDP and its main expenditure components can be found in Table 1.3; the calculation of these chained volume measures are explained below.

The production approach

The production approach to the estimation of GDP, which is also referred to as the output approach, looks at the contribution to production of each economic unit; that is the value (at basic prices) of their total output **less** the value of the inputs used up in the production process. The sum of these gross values added, **plus** taxes and **less** subsidies on products for all producers, is GDP at market prices: the production account balancing item. The following paragraphs give a brief overview of the methodology. It should be noted that the production approach concentrates on the basic price concept.

In theory, chained volume measures of value added should be estimated by double deflation; that is, deflating separately the inputs and the outputs of each economic unit (valued in chained volume measures) and then subtracting one from the other. But, because it is hard to get reliable information from

companies, double deflation is only used in the estimation of output for the agriculture and electricity industries. So for most industries, movements in the chained volume measures for gross value added are estimated by the use of output series. For industries whose outputs are goods, output can be estimated from the physical quantities of goods produced or from the value of output deflated by an index of price.

Apart from the use of output to estimate chained volume measures of value added, which accounts for around 80 per cent of the total of the production measure, a number of other kinds of indicator might be used as a proxy for the change in gross value added. For example, they may be estimated by changes in inputs, where the inputs chosen may be materials used, employment or some combination of these.

In the short-term it is reasonable to assume that movements in value added can be measured this way. However, changes in the ratio of output and inputs to gross value added can be caused by many factors: new production processes, new products made and inputs used, and changes in inputs from other industries will all occur over time. Aggregated over all industries the impact of these changes will be lessened. In the longer term all indicators are under constant review, with more suitable ones being used as they become available.

The estimate of gross value added for all industries (the proxy for the quarterly production measure of GDP) is finally obtained by combining or ‘weighting together’ the estimates for each industrial sector according to its relative importance (as established in the Input-Output Supply and Use Tables). For each year these weights are based on Input-Output data for the immediately preceding year, except for the most recent years where the weights are based on Input-Output data for 2006. This use of previous years’ weights is a feature of the move to annual chain-linking, introduced in this edition of the *Blue Book* (see ‘UK GDP Chained Volume Measures’ below). Data can be found in Table 2.4.

Headline GDP

The chained volume measure of **gross domestic product at market prices** provide the key indicator of the state of the economy; this is sometimes called ‘headline’ GDP. The chained volume measure of **gross value added at basic prices** (GVA), another useful short-term indicator of growth in the economy, is the headline measure for the production approach. It is compiled in a way which is relatively free of short-term fluctuations due to uncertainties of timing. The construction of chained volume measures of **gross domestic product at factor cost** however, requires an adjustment for the relevant taxes and subsidies which can be subject to erratic changes.

As a result the factor cost measure is less suitable as an indicator of short-term movements in the economy.

The figure below shows the distinction between market prices, basic prices and factor cost measures.

ESA95 code	
	Gross domestic product, at market prices
D.211	<i>Less value added taxes (VAT) on products</i>
D.212, D.214	<i>Less other taxes on products (for example, alcohol duty)</i>
D.31	<i>Plus subsidies on products</i>
	Gross value added, at basic prices
D.29	<i>less taxes on production other than taxes on products (for example, business rates, vehicle excise duty paid by businesses and operating licences)</i>
	Gross value added, at factor cost

GDP at market prices includes taxes on production, whilst GDP at basic prices includes only those taxes on production, such as business rates which are not taxes on products and GDP at factor cost excludes all taxes on production. A more detailed explanation of taxes follows.

Taxes

Taxes on production and imports including taxes on products (D.2), along with subsidies (D.3) (which can be regarded as negative taxes) make up the factor cost adjustment which represents the difference between GDP at market prices (sum of final expenditures) and GVA at factor cost (sum of incomes). This adjustment has to be added to the sum of incomes to obtain GDP at market prices. The basic price adjustment, which is the sum of **taxes on products** (D.21) *less* **subsidies on products** (D.31), is the difference between GVA at basic prices and GDP at market prices. Details of the taxes which comprise **taxes on production** are included in Table 11.1.

Taxes on production and imports (D.2) are taxes paid during the production or import of goods and services. They are paid irrespective of whether profits are made. They comprise taxes on products (D.21) and other taxes on production (D.29).

Taxes on products (D.21) are taxes paid per unit of good or service produced, sold, leased, transferred, exported or imported. They are included in the prices paid to suppliers of goods and services, so they are included in intermediate consumption at purchasers' prices (except for deductible VAT). Fuel duty is an example.

Deductible VAT differs from other **taxes on products**. It is levied like other **taxes on products** but producers are reimbursed by government for the amount they pay when goods and services are bought. Intermediate consumption at

purchasers' prices is the price paid less deductible VAT refunded. The value of sales or production at **producers' prices** also excludes any deductible VAT charged.

Suppliers are required to pay to government any **taxes on products** included in their prices. So the supplier's net revenue from selling the good is the selling price less the taxes on products included in the selling price. This is the **basic price**. It is the price at which market output is measured since it represents the producers' actual revenue.

Other taxes on production (D.29) are taxes which producers have to pay but they are not paid when goods and services are bought and so are not included in intermediate consumption. They are levied separately and are usually linked to the use of fixed capital or to the right to undertake certain regulated activities. Examples are non-domestic rates, vehicle excise duty, and various licence fees where the fee is much higher than the cost of administering the licence and so, in effect, is classified as taxation.

Other aggregates – Gross national disposable income

In the discussions so far we have yet to consider the measure which represents the total **disposable income** of the country's residents. Gross national income (GNI) represents the **total income** of UK residents and is the balancing item of the UK allocation of primary income account. It can also be derived from GDP by adding net employment income and net property income from the rest of the world. However there are two other areas which affect UK residents' command over resources.

First, there are flows into and out of the country which are not concerned with economic production. These are current transfers from abroad and current transfers paid abroad. They include transactions with the European Union, overseas aid and private gifts. An estimate of gross national disposable income (GNDI) is reached by adjusting GNI by the amount of net income received. GNI and GNDI are shown in Table 1.1.

Second, disposable income is affected by the terms of trade effect. Some of the expenditure by UK residents is on imported goods and services; some of the income earned by residents is from exports of goods and services. If UK export prices fall relative to the price of imports then the terms of trade effect would move against the UK; that is, residents would have to sell more exports to be able to continue to buy the same amount of imports. The purchasing power of UK residents would be diminished to this extent. Similarly, if UK export prices rose relative to prices of imports then the effect would be opposite: the purchasing power of residents would rise. An adjustment is made specifically for the terms of trade effect in

calculating the chained volume measure of GNDI, also shown in Table 1.1.

UK GDP chained volume measures (Tables 1.1, 1.3, 1.4)

When looking at the change in the economy over time, the main concern is usually whether more goods and services are actually being produced now than at some time in the past. Over time, changes in current price GDP show changes in the monetary value of the components of GDP. As these changes in value can reflect changes in both price and volume, it is difficult to establish how much of an increase in the series is due either to increased activity in the economy or to an increase in the price level. It is therefore useful to measure GDP in real terms (that is, excluding price effects) as well as at current prices. In most cases the revaluation of current price data to remove price effects (known as deflation) is carried out by using price indices such as component series of the retail prices index or producer price index to deflate current price series at a detailed level of disaggregation. In the 2003 edition of the *Blue Book* a new method of measuring GDP in real terms, **annual chain-linking**, was introduced to replace fixed base chain-linking which was used in previous editions of the *Blue Book*. The real GDP time series produced by annual chain-linking are referred to as **chained volume measures**.

In the UK economic accounts the expenditure approach is used to provide current price and chained volume measures of GDP. Because of the difficulties in accounting for changes in labour productivity it is not possible to obtain direct chained volume measures of GDP from the income data. However, an approximate aggregate measure is calculated by deflating the current price estimates using the GDP deflator derived from the expenditure measure for balancing purposes. The production measure of GDP is largely based on output measures.

The introduction of annual chain-linking

The fixed-base chain-linking method, which was used in editions of the *Blue Book* prior to 2003, produced 'constant price' estimates of GDP whereby the price structure prevailing in 1995 was used to compile data from 1994 onwards. For years prior to 1994 more appropriate pricing structures were used and, in order to link all of the 'constant price' estimates to produce continuous time series, a process of chain-linking was used whereby blocks of constant price data with different price bases were linked together. In the link years, figures were calculated with reference to two consecutive base years to obtain a linking factor so that the whole time series could be shown with reference to the latest base year. This system of fixed-base chain-linking is described in more detail at pages 36 to 38 of the 2002 edition of the *Blue Book*.

In the 2003 edition of the *Blue Book*, the fixed-base chain-linking method was replaced with an annual chain-linking process which produces 'chained volume measures' of GDP. Chained volume measures are calculated by applying the price structure prevailing in the previous year for each year, except the most recent available years where chained volume measures are calculated by applying the price structure prevailing in 2006. The year 2006 is therefore the 'latest base year' for chained volume measures published in this edition of the *Blue Book*. Thus estimates for 2007 to 2009 inclusive are based on 2006 prices, estimates for 2006 are based on 2005 prices and so on. These 'previous years prices' data are chain-linked to produce continuous time series called 'chained volume measures', in a similar fashion to the fixed-based chain-linking described in the above paragraph.

These chained volume measure series are shown in £ million and referenced onto the 'latest base year' which is 2006 in this edition of the *Blue Book*. Current price data therefore equals chained volume measures annually in 2006. The process of annually chain-linking 'previous years prices' data onto a continuous time series referenced onto the latest base year results in a loss of additivity in the annual data prior to the latest base year. Thus chained volume measures prior to 2006 are non-additive in this edition of the *Blue Book*. Usually the 'latest base year' and therefore the 'reference year' will move forward by one year.

In the expenditure measure of GDP all of the components are annually chain-linked, as described above, and the chained volume measure of total GDP is aggregated from these. The output approach involves weighting together the detailed components using the contribution to current price GVA (or weight) in the immediately preceding year and annually chain-linking to produce a continuous time series. The application of annual chain-linking to the output measure of GDP is described in detail in an article published in the October 2001 edition of *Economic Trends*.¹

Annual chain-linking provides more accurate measures of growth in the economy than that provided by the old method of fixed-base chain-linking because more up to date, and therefore more appropriate, price structures are used. The move to annual chain-linking is also consistent with international guidelines laid down in the *System for National Accounts 1993 (SNA93)*.

Index numbers and price indices

Some chained volume measure series are expressed as index numbers in which the series are simply scaled proportionately to a value of 100 in the reference year. These index numbers are volume indices of the 'base weighted' or 'Laspeyres' form.

(see chapter 2 of *Concepts, Sources and Methods*²) Aggregate price indices are of the 'Paasche' or 'current-weighted' form. They are generally calculated indirectly by dividing the current price value by the corresponding chained volume measure and multiplying by 100. Examples are the GDP deflator and the households' consumption deflator.

Value indices are calculated by scaling current price values proportionately to a value of 100 in the reference year. By definition such a value index, if divided by the corresponding volume index and multiplied by 100, will give the corresponding price index.

Population, employment and GDP per head (Table 1.5)

Population and employment data are supplementary to the system of accounts. The estimated population of the UK is as at 30 June and includes all those resident in the UK, whatever their nationality. They include members of both UK and non-UK armed forces and their dependants stationed in the UK and exclude members of H.M. armed forces stationed in the rest of the world. This is recognised as not being in strict accord with ESA95 requirements, which are for all UK armed forces and dependants, wherever stationed, to be included and all non-UK ones to be excluded. At present, this is the most appropriate estimate available; it is used to calculate GDP per head.

The total employment data are from the UK Labour Force Survey (LFS) which is recognised as the most appropriate source for coherent national aggregate labour market estimates. The LFS is a household survey which uses definitions which are consistent with the International Labour Organisation recommendations and have been adopted by all EU member countries. The coverage of the LFS is people living in private households and, from 1992, student halls of residence and NHS accommodation; it is not precisely consistent with either the home population data or the ESA95 requirements.

The employment data in the table are estimates of people according to their economic and employment status. They are not comparable with estimates of jobs, as shown in Table 2.5, as some people have more than one job. The total employment figures include people on government sponsored training and employment programmes and unpaid family workers.

UK summary accounts (Tables 1.6.0 – 1.6.9)

The UK summary accounts show the full set of accounts for the UK total economy. The accounts comprise the goods and services account, the production account, the distribution and use of income account and the accumulation accounts. The structure of the accounts is explained in the introduction.

UK summary accounts by sector (Tables 1.7.1 – 1.7.9)

The framework

As can be seen in Table 1.7, the UK sector accounts can be used to show the economic accounting framework in considerable detail by elaborating the accounts in three different dimensions:

- the institutional sectors
- the types of transaction
- the national and sector balance sheets

The institutional sectors

The first dimension involves the breakdown of the current account into institutional sectors grouped broadly according to their roles in the economy. Examples of these roles are: income distribution, income redistribution, private consumption, collective consumption, investment, financial intermediation, etc. Most units have more than one role but a natural classification is to distinguish between corporations, government and households. The rest of the world sector is also identified as having a role although it is obviously not part of the domestic economy.

The types of transaction

The second dimension is that of the type of transaction which relates to the particular account within which the transaction appears. These can be grouped broadly according to purpose, whether current, capital or financial.

Summary of the UK institutional sectors

Sectors and sub-sectors	ESA95	code
Non-financial corporations	S.11	
Public		S.11001
National private and foreign controlled		S.11002/3
Financial corporations	S.12	
Central bank		S.121
Other monetary financial institutions		S.122
Other financial intermediaries		S.123
Financial auxiliaries		S.124
Insurance corporations and pension funds		S.125
General government:	S.13	
Central government		S.1311
Local government		S.1313
Households	S.14	
Non-profit institutions serving households (NPISH)	S.15	
Rest of the world	S.2	

The balance sheets

To complete the full set of accounts the system includes balance sheets and a reconciliation of the changes that have brought about the change between the beginning and the end of the period. At present the UK does not compile the latter except for the general government sector which are available in the ONS Public sector finances release.

In theory the net lending or borrowing from the capital account for each sector should equal the net borrowing or lending from the financial account. In practice, because of errors and omissions in the accounts, a balance is rarely achieved and the difference is known as the **statistical discrepancy** although, across all accounts, when an Input-Output balance is available, these sum to zero. Consolidating the current and accumulation accounts would provide a balanced account which would look like many of the presentations of commercial accounts.

Spurious accuracy and rounding to the nearest £ million

One final point must also be made about the reliability of the statistics. In most of the published tables no attempt is made to round estimates beyond the nearest £ million. In some instances this shows figures which appear to have more precision than evidence warrants.

The reasons for this presentation are as follows:

- rounded figures can distort differences over time or between items
- some of the estimates in the tables are fairly precise and, if such an estimate is small, rounding would unnecessarily distort what it shows; yet if such series were not rounded to the nearest £ million the major aggregates of which they are components would appear precise even though other components were heavily rounded
- not rounding beyond the nearest £ million aids users who prepare derived statistics, by avoiding the accumulation of rounding errors which can occur when a number of rounded numbers are manipulated
- in presenting numbers to the nearest £ million, the rounding is usually such that the components add to the total at current prices, so that the accounts balance. In particular the quarterly estimates, both before and after seasonal adjustment, add up to the calendar year totals. However, there are some small differences between the sum of component series and the total shown, due to rounding

Changes since last year's Blue Book

An analysis of revisions in current prices since last year's Blue Book is shown in Table B.

B Revisions since ONS Blue Book, 2009 edition

	£ million							
	2001	2002	2003	2004	2005	2006	2007	2008

Taxes on production and imports	—	—	—	—	—	—	35	397
less subsidies	—	—	—	—	—	5	-72	458
Statistical discrepancy (income)	—	—	—	—	—	—	—	1 767

The revisions to the aggregate GDP levels and growth from 2006 to 2008 are as a result of balancing of those years through the supply and use framework and the incorporation of annual benchmark survey estimates, especially the Annual business Inquiry. In this year's *Blue Book*, 2006 and 2007 have been re-balanced and 2008 has been balanced for the first time. More details can be found in chapter 2 of this publication. There are no revisions to current price data before 2006.

Chained volume estimates and index numbers have been updated as the reference year has been advanced from 2005 to 2006. This change has an impact on the entire time series for affected series although there are no significant changes to growth rates before 2006.

1 Components may not sum to totals due to rounding.

2 These seasonally adjusted data are 4 quarter annual averages derived from quarterly Labour Force Survey, which does not include those resident in communal establishments except for those in student halls of residence and NHS accommodation.

3 Includes people on Government-supported training and employment programmes and unpaid family workers.

4 This data is consistent with the population estimates published on 24 June 2010.

2 Interest is recorded within the allocation of primary income account

An aerial, high-angle photograph of a large, crowded public space, likely a transit hub or a busy pedestrian plaza. The floor is made of light-colored, rectangular tiles. Numerous people are seen from above, walking in various directions. Some are carrying bags or backpacks. In the upper right, there are some structural elements like railings or stairs. The overall scene is one of a busy, populated environment.

The industrial analyses

Part 2

Chapter 2

The industrial analyses at a glance from Table 2.1

Gross value added at basic prices by industry

An analysis of the 11 broad industrial sectors shows that in 2008 the financial intermediation and other business services sector provided the largest contribution to gross value added at current basic prices, at £420 billion out of a total of £1,295.7 billion (32.4 per cent). The distribution and hotels sector contributed 14.2 per cent; the education, health and social work sector accounted for 13.1 per cent; and the manufacturing sector 11.6 per cent.

Breakdown of gross value added at basic prices by industry for 2008

Final demand

In 2008, just under half (46.8 per cent) of all goods and services entering into final demand were purchased by consumers, 16.5 per cent were consumed by government, both central and local, and 22.2 per cent were exported. Gross capital formation by all sectors of the economy amounted to 12.7 per cent of the total.

Composition of final demand for 2008

Compensation of employees by industry

The financial intermediation and other business services sector showed the highest level of compensation of employees in 2008 at £179.9 billion. After the financial sector, the second largest industry in terms of its contribution to total compensation of employees was the education, health and social work sector at £145.2 billion.

Compensation of employees by industry, 2008

Explanation of industrial analyses

Input-Output Supply and Use tables

The annual estimates prepared for the *Blue Book* incorporate the results of annual inquiries which become available in the first part of the year, although estimates for the latest year are still based largely on quarterly information. As new data are collected it is likely that revisions will be necessary. The process of reassessing these estimates involves the preparation of Supply and Use tables. This approach amalgamates all the available information on inputs, outputs, gross value added, income and expenditure. Similarly the production of the consolidated sector and financial accounts requires the preparation of 'top-to-bottom' sector and sub-sector accounts to identify discrepancies in the estimates relating to each sector. The thorough and detailed nature of this estimation process require a large amount of time and resource and so estimates for earlier years are not normally revisited unless there are strong reasons for doing so.

GDP and the balancing of the annual accounts

As discussed in Part 1, there are three different approaches to the estimation of current price GDP in the UK: the income approach, the expenditure approach and the production approach. In theory the three different approaches should produce the same result. However, the different approaches are based on different surveys and administrative data sources and each produces estimates which, like all statistical estimates, are subject to errors and omissions. A definitive GDP estimate can only emerge after a process of balancing and adjustment. ONS believes that the most reliable 'definitive' estimate of the current price level of GDP is that derived using the annual Supply and Use tables framework. Thus, for the years when Supply and Use tables are available, GDP is set at the level derived from that year's balance. For periods subsequent to the latest Supply and Use tables, the level of GDP is carried forward using movements in income, expenditure and production totals.

The Supply and Use framework

The accounting framework shown in Figure 1 in the Introduction is mainly concerned with the composition and

value of goods and services entering into final demand (for example, purchases by consumers) and the outputs and incomes generated in the production process. It does not display the inter-industry transactions which link these activities.

The UK Supply and Use tables, however, do include these intermediate transactions which form inputs into these processes, thus providing an extra dimension. The analyses are constructed to show a balanced and complete picture of the flows of products in the economy and illustrate the relationships between producers and consumers of goods and services. On an annual basis, Supply and Use tables are used to achieve consistency in the economic accounts' aggregates by linking the components of value added, inputs, outputs and final demand. As the income, production and expenditure measures of GDP can all be calculated from the Supply and Use tables, a single estimate of GDP can be derived by balancing the supply and demand for goods and services and reconciling them with the corresponding value added estimates. For the years 1989 to 2008, the balancing process has been used to set the level of current price GDP and has disposed of the need for statistical discrepancies in the form of a GDP expenditure adjustment and a GDP income adjustment.

Industrial analyses

The process, which produces Supply and Use tables annually, has been speeded up considerably over the last few years and can now produce the first balance for a year around 18 months after the end of that year. These full Supply and Use tables, consistent with the *National Accounts Blue Book*, are published as a separate web-only publication at the same time as the *Blue Book*. The latest annual Supply and Use tables¹ cover the periods 2006 to 2008, with summary information provided in the *Blue Book* itself.

Some background on the structure of the Supply and Use tables

The Supply and Use tables are based on a framework which incorporates estimates of industry inputs, outputs and value added. The tables consist of two matrices: the *Supply* table

and the *Use* table, each of which breaks down and balances 108 different industries and 123 products at purchasers' prices. The following paragraphs summarise the methodology. For more detail see Akers and Clifton-Fearnside (2008).²

Supply table

At a very aggregate level the *Supply* table can be represented as follows:

	Output by industry	Imports of goods and services	Dis-tributors' trading margins	Taxes less subsidies on products
Output by product				

The main part of the *Supply* table shows estimates of domestic industries' output (total sales adjusted for changes in inventories of work in progress and finished goods) compiled at basic prices. Basic prices value the goods leaving the factory gate but exclude any taxes on products and include any subsidies on products. However, for the balancing process, the estimates of supply of products are required at purchasers' prices, that is, those actually paid by the purchasers to take delivery of the goods, excluding any deductible VAT. To convert the estimates of domestic output valued at basic prices to the total supply of products valued at purchasers' prices requires the addition of:

- the value of imports of goods and services
- distributors' trading margins
- taxes on products (for example, VAT, excise duties, air passenger tax and insurance premium tax)

less

- subsidies on products (for example, agricultural and transport subsidies)

Use table

The *Use* table reveals the input structure of each industry in terms of combined domestic and imported goods and services.

Industry consumption/final demand table

	Industry consumption	Final demand
<i>Products consumed</i>	Shows consumption by each industry to produce their own output (that is, intermediate consumption)	Shows final demand categories (for example, households' expenditure) and the values of products going to these categories
<i>Primary inputs</i>	Shows the gross value added components of each industry, taxes less subsidies on production other than product specific taxes and subsidies, compensation of employees and gross operating surplus	

It also shows the product composition of final demand and, for each industry, the intermediate purchases adjusted for changes in inventories of materials and fuels. Consumption of products is represented in the rows of the balance while purchases by industries, and final demands, are represented in the columns. At a very aggregate level the *Use* table can be considered in three parts as shown below.

The body of the matrix, which represents consumption of products, is at purchasers' prices and so already includes the product-specific taxes and subsidies separately added in the *Supply* table.

The *Supply–Use* balance is effectively achieved when:

For industries:

Inputs (from the *Use* table)

equals

Outputs (from the *Supply* table)

For products:

Supply (from the *Supply* table)

equals

Demand (from the *Use* table)

That is, when the data from the income, expenditure and production approaches used to fill the matrices all produce the same estimate of current price GDP at market prices. GDP at current market prices can be derived from the balances by taking the estimate of total gross value added at basic prices (from the *Use* table) and adding taxes on products and deducting subsidies on products (from the *Supply* table).

The balancing process

The *Supply* and *Use* tables produced this year use the same methods first employed in the 2008 edition of the *Blue Book* (see Akers and Clifton-Fearnside (2008)²). A detailed description of the methods and process used for the 2006, and earlier, editions of the *Blue Book* can be found in Mahajan (2006)³.

The current approach utilises new computing systems resulting from the ONS programme for the modernisation of its statistical systems and processes. The process of balancing

includes the compilers of the basic data that form the input to the process. These individuals bring with them an understanding of the data that is being used to populate the Supply and Use framework. If we consider the Supply and Use framework as a column (industry) and row (product) matrix the process of balancing consists of a series of row and column confrontations of the data.

The first interrogation of data takes place before the Supply and Use framework is populated. It consists of an examination of the columns in the framework being reviewed for plausibility independently of each other. For example, estimates of household consumption expenditure, by product, are produced and analysed to ensure the overall picture of household spending and its breakdown by product presents a credible story in their own right. Similarly, for those components with an industry dimension, such as output, the initial stage scrutinises these data to ensure the story for industries look plausible. This first stage is carried out by the compilers of the original data.

The second stage is a confrontation within the framework of the rows (products) in the Supply and Use framework. The accounting relationship that supply is equal to demand is tested for each product. This process identifies areas of inconsistency between the various sources which can then be investigated. Data within the row are then subsequently adjusted to achieve a balance. This adjustment process reviews the quality of the data used to populate the individual cells within a row and makes use of this information to adjust the original data.

The third stage of the balancing process is to confront the columns. Unlike the interrogation within the column, carried out during the first stage, this time it is carried out in the context of the Supply and Use framework. While the second stage of balancing results in a balance of the rows, it does not result in satisfying the accounting relationship for the columns. This needs to ensure that for each industry the inputs to the process of production equal its outputs. This third stage of balancing has the objective of confirming that this column identity is satisfied.

Once stage three is complete there is a strong probability that the row identities balanced during stage two of the process will have subsequently been broken. The process of repeating stages two and three continues until both the row and column identities are satisfied. This iterative process of row and column balancing effectively homes in on a position of balance by way of narrowing the degree of imbalance remaining in the Supply and Use framework after each balancing cycle. While the description above may seem to indicate a fairly mechanistic balancing approach, a significant amount of knowledge of the

methods and quality of the basic data are used as part of the process. Alongside this, the evolving balance is reviewed at each stage to see how the economic story is developing and make sure that story is credible.

Current price analysis (Tables 2.1, 2.2 and 2.3)

The analyses of gross value added and other variables by industry shown in Part 2 reflect estimates based on the Standard Industrial Classification (SIC(2003)). Tables 2.1, 2.2 and 2.3 are based on current price data reconciled through the Input–Output (I–O) process for 1992 to 2008.

Estimates of total output and gross value added are valued at basic prices, the method recommended by ESA95 (the European System of National and Regional Accounts, 1995). Thus the only taxes included in the price will be taxes paid as part of the production process (such as business rates and vehicle excise duty), and not any taxes specifically levied on the production of a unit of output (such as VAT). Any subsidies on products received will also be included in the valuation of output.

Chained volume indices (2006=100) analyses (Table 2.4)

Table 2.4 shows chained volume estimates of gross value added at basic prices by industry. The source data for these estimates can be found in the GDP(O) source data guide on the ONS website:

www.ons.gov.uk/about-statistics/user-guidance/ios-methodology/source-data/index.html

A more detailed explanation is in *Concepts, Sources and Methods*.⁴

The output approach provides the lead indicator of economic change in the short-term. However in the longer-term, it is required to follow the annual path indicated by the expenditure measure of real GDP (usually within 0.2 per cent of the average annual gross value added growth). To achieve this, balancing adjustments are sometimes applied to the output based gross value added estimates.

An examination of the chained volume gross value added and expenditure measures of GDP shows what are considered to be excessive differences in growth for a number of recent years.

The output-based estimate grew less quickly than the expenditure measure in 2006 but more quickly in 2007 and 2008.

The largest difference in growth between the output and expenditure GVA measure was 0.6 per cent, which occurred in 2008.

To reduce these discrepancies, a number of balancing adjustments have been made to the chained volume gross value added annual growth rates.

Assigning adjustments: improvements for the 2010 Blue Book

For this year's *Blue Book*, balancing adjustments have been applied on the same basis as for the 2009 *Blue Book*. For technical and other reasons, the adjustments are not at present made to the non-service industries for any years.

Applying the adjustments

ONS has developed an automatic function for assigning the annual adjustments to gross value added. This is designed to be as faithful as possible to the quarterly paths whilst adjusting the overall annual growth rate of a group of series. Details of the new adjustments are given below. Using the automatic function produces some differences in the adjustments within the groupings shown.

For 2006:

An upwards adjustment of 0.1 per cent has been applied to:

- distribution, hotels and restaurants; (sections G and H)

An upwards adjustment of 0.3 per cent has been applied to:

- transport, storage and communication (section I)

An upwards adjustment of 0.3 per cent has been applied to:

- Business Services and Finance (section J and K)

An upwards adjustment of 0.3 per cent has been applied to:

- government and other services (sections L to P)

The total effect of these adjustments is to increase the 2006 growth rate by 0.2 per cent.

For 2007:

A downwards adjustment of –0.1 per cent has been applied to:

- distribution, hotels and restaurants; (sections G and H)

A downwards adjustment of –0.2 per cent has been applied to:

- transport, storage and communication (section I)

A downwards adjustment of –0.2 per cent has been applied to:

- Business Services and Finance (section J and K)

A downwards adjustment of –0.2 per cent has been applied to:

- government and other services (sections L to P)

The total effect of these adjustments is to decrease the 2007 growth rate by 0.1 per cent.

For 2008:

A downwards adjustment of –0.3 per cent has been applied to:

- distribution, hotels and restaurants; (sections G and H)

A downwards adjustment of –0.9 per cent has been applied to:

- transport, storage and communication (section I)

A downwards adjustment of –0.9 per cent has been applied to:

- Business Services and Finance (section J and K)

A downwards adjustment of –0.9 per cent has been applied to:

- government and other services (sections L to P)

The total effect of these adjustments is to decrease the 2008 growth rate by –0.6 per cent.

Workforce jobs by industry (Table 2.5)

Workforce Jobs (WFJ) is the preferred measure of the change in employment by industry. The number of jobs is not the same as the number of people employed. This is because a person can have more than one job.

Table 2.5 breaks down WFJ into six broad industry groupings on SIC 2003. WFJ is also now available on SIC 2007, but SIC 2003 has been used for this table to be consistent with other *Blue Book* tables.

Employee jobs, the main component of WFJ are obtained mainly from surveys of businesses selected from the Inter-Departmental Business Register (IDBR). This is the same register used for all other business surveys collecting economic data.

Self-employment jobs come from the Labour Force Survey (LFS). This is a household survey which codes respondents according to their own view of the industry in which they work and so the industry breakdown is less reliable than the business surveys.

WFJ also includes Her Majesty's Forces (contained within industry section L) and government supported trainees from administrative sources (split by industry using the LFS).

Notes for information										
(1) Some of the industry/product group headings have been truncated.										
(2) Purchases of products by industry and by final consumption categories are valued at purchasers' prices.										

Notes for information

- (1) Some of the industry/product group headings have been truncated.
 (2) Purchases of products by industry and by final consumption categories are valued at purchasers' prices.

NPISHs represents Non-Profit Institutions Serving Households.
 GGFC represents General Government Final Consumption.
 GFCF represents Gross Fixed Capital Formation.

Gross value added at basic prices *plus* taxes *less* subsidies on products gives GDP at market prices.
 Gross operating surplus includes gross mixed income.
 Changes in inventories includes materials and fuels, work-in-progress and finished goods.
 Valuables include both 'transfer costs' and 'acquisitions less disposals'.

1 The contribution of each industry to the gross domestic product before providing for consumption of fixed capital. The industrial composition in this table is consistent with the Input-Output Supply and Use Tables in Table 2.1, which show data from 2006-2008

2 Components may not sum to totals due to rounding.

3 Further detail is given in Table 2.3.

1 Components may not sum to totals as a result of rounding.

2 Because of differences in the annual and monthly production inquiries, estimates of current price output and gross value added by industry derived from the current price Input-Output Supply and Use Tables are not consistent with the equivalent measures of chained volume measures growth given in 2.4. These differences do not affect GDP totals.

2.4 Gross value added at basic prices: by industry^{1,2,3}

1 The weights shown are in proportion to total gross value added (GVA) in 2006 and are used to combine the industry output indices to calculate the totals. For 2005 and earlier, totals are calculated using the equivalent weights for the previous year (e.g. totals for 2005 use 2004 weights). Weights may not sum to totals due to rounding.

2 As GVA is expressed in index number form, it is inappropriate to show as a statistical adjustment any divergence from the other measures of GDP. Such an adjustment does, however, exist implicitly.

3 See footnote 2 to Table 2.3.

An aerial, high-angle photograph of a large, open public square, likely St. Peter's Square in Rome, showing a large number of people walking in various directions. The square is paved with light-colored stone tiles. In the background, there are architectural structures, including a large colonnade and a fountain. The entire image is overlaid with a semi-transparent blue filter.

The sector accounts

Part 3

The sector accounts at a glance

Net lending/borrowing

Net borrowing by general government increased in 2009 to £150.4 billion, compared with net borrowing of £68.6 billion in 2008. The non-financial corporations sector was a net lender, with £66.6 billion in 2009 and £35.1 billion in 2008. The households and non-profit institutions serving households (NPISH) sector was a net lender of £27.3 billion in 2009, compared with a net borrower of £41.0 billion in 2008. Financial corporations were net lenders in 2009 at £43.9 billion, from net lending of £54.0 billion in 2008. Rest of the world sector net lending was £12.3 billion in 2009, compared with £20.5 billion in 2008.

Net lending/borrowing, 2009

Net financial transactions

Net financial transactions by general government showed a deficit of £151.2 billion in 2009, compared with a £69.0 billion deficit in 2008. Non-financial corporations show a surplus of £58.0 billion in 2009, compared with a £44.2 billion surplus in 2008. Households and NPISH showed a surplus of £35.6 billion in 2009, compared with a deficit of £49.8 billion in 2008. In 2009 financial corporations showed a surplus of £52.1 billion, following a surplus of £48.8 billion in 2008. The rest of the world sector showed a surplus of £5.6 billion in 2009, compared with £25.8 billion in 2008.

Net financial transactions

Gross trading profits of private non-financial corporations

Gross trading profit is the largest component of private non-financial corporations' gross operating surplus. Profits decreased by 10.2 per cent between 2008 and 2009 compared with an increase of 2.0 per cent between 2007 and 2008.

Gross trading profits of private non-financial corporations

Real household disposable income

Real household disposable income (RHDl) is the amount of money in real terms the household sector has available for spending, after taxes and other deductions. Between 2008 and 2009 RHDl increased by 1.8 per cent, compared with an increase of 1.1 per cent between 2007 and 2008.

Annual changes in real household disposable income

Household saving ratio

The household saving ratio reflects household gross savings as a percentage of their total available resources (the amount available to invest or save). Household resources rose by 3.1 per cent between 2008 and 2009. Household and NPISH final consumption expenditure decreased by 2.1 per cent in the same period. As a consequence, the household saving ratio rose to 7.0 in 2009 from 2.0 in 2008.

Household saving ratio

The sector accounts

The sector accounts show the relationships between different sectors of the economy and different types of transactions. They summarise the transactions of particular groups of institutions in the economy, showing how the income from production is distributed and redistributed, and how savings are used to add wealth through investment in physical or financial assets. This section introduces the tables in Chapters 3 to 7 which deal with individual areas and subdivisions of the accounts. This introduction to the sector accounts has been divided into the following areas:

- framework of the accounts
- institutional sectors
- types of transactions
- sequence of accounts
- statistical adjustment items
- balance sheets

Framework of the accounts

The framework of national accounts detailed in Part 1 highlights the five main types of accounts; goods and services, production, distribution and use of income, capital and financial. The production account records the activity of producing goods and services. The distribution and use of income accounts record how incomes are generated by production, distributed to institutional units with claims on the value added created by production, redistributed among institutional units, and eventually used by households, government units or non-profit institutions serving households for purposes of final consumption or saving. The capital account records the flows of non-financial assets acquired and disposed. The financial account shows how the net lending or borrowing on the capital account is financed by transactions in financial instruments.

The distribution and use of income accounts can be elaborated to form a consistent set of sector accounts. This is done in two dimensions, by sectors and types of transaction. A third dimension, related to capital and financial transactions, is that of asset and liability levels on the national and sector balance sheets. The sectors and types of transaction are described below.

Institutional sectors

The system identifies two kinds of institutions: consuming units (mostly households) and production units (mainly corporations

and non-profit institutions or government). Units can own goods and assets, incur liabilities and engage in economic activities and transactions with other units in their own right. All units within the country are put in one of the sectors. Also, the rest of the world is treated as a sector in respect of its dealings with the United Kingdom.

Non-financial corporations are those which exist to produce goods and non-financial services. They are, in the UK, mainly public limited companies, private companies and partnerships. They are mostly owned privately but there are some public corporations which are shown separately.

Financial corporations are those engaged primarily in financial activities and are subdivided into monetary financial institutions, other financial intermediaries and financial auxiliaries and insurance corporations and pension funds.

General government comprises central government and local government.

The household sector contains all the resident people of the United Kingdom as receivers of income and consumers of products. It includes individuals such as prisoners as well as conventional family units. It also contains unincorporated enterprises (except quasi-corporations). This sector currently includes non-profit institutions serving households which include productive units such as charities and universities.

The rest of the world sector comprises those units that are not in the United Kingdom. The accounts for the rest of the world only record transactions between units in the rest of the world and units in the UK, and are equivalent to the balance of payments.

The tables in Chapters 3 to 7 are based on the sector classification detailed above. More detailed definitions of these sectors are given in the appropriate chapters of the *UK National Accounts Concepts, Sources and Methods* and, in full detail, in the Business Monitor MA23 *Sector classification for the national accounts* available from the ONS website.

Types of transactions

The other dimension is that of the types of transactions. These are divided into three types:

- **Transactions in products** are related to goods and services. They include output, intermediate and final consumption, gross capital formation and exports and imports

- **Distributive transactions** transfer income or wealth between units of the economy. They include property income, taxes and subsidies, social contributions and benefits and other current or capital transfers
- **Financial transactions** differ from distributive transactions in that they relate to transactions in financial claims by one unit on another, whereas distributive transactions are unrequited. The main categories in the classification of financial instruments are monetary gold and special drawing rights; currency and deposits; securities other than shares; loans; shares and other equity; insurance and pension funds reserves; and other accounts receivable/payable.

Sequence of accounts

Transactions can be grouped broadly according to purpose in the production, distribution and use of income, capital, or financial accounts. These are described briefly below:

Production account

The production account displays the transactions involved in the generation of income by the production of goods and services. This account is produced for the UK total economy (Table 1.6.1) and for the first four sectors (Tables 3.1.1, 4.1.1 etc.); the rest of the world does not have a production account. For each of the four sectors, the balancing item gross value added is shown as output *less* intermediate consumption. Gross value added at basic prices for each sector differs from gross domestic product for the UK total economy in that taxes *less* subsidies on products are not taken into the production accounts by sector but they are included within resources for the UK total economy. The sum of gross value added and taxes *less* subsidies on products for the UK economy is GDP at market prices.

Distribution and use of income account

The distribution and use of income accounts exist for all the main institutional sectors. To obtain the disposable income and savings of each sector we need to take account of transfers in and out of the sector. The accounts are not consolidated, so that in the whole economy account, transfers such as social contributions and benefits appear in both uses and resources.

These accounts describe the distribution and redistribution of income and its use in the form of final consumption. The distribution and use of income are analysed in four stages, each of which is presented as a separate account:

- generation of income account
- allocation of primary income account
- secondary distribution of income account
- use of disposable income account

Generation of income account

This is the first of the distribution and use of income accounts. It shows the sectors, sub-sectors and industries which are the source, rather than the destination, of income. It shows the derivation of the 'profit' arising from production, called the operating surplus (or mixed income in the case of unincorporated businesses in the households sector). The industry dimension is shown in Part 2, Table 2.1.

This account analyses the degree to which value added covers the compensation of employees (their wages and salaries, etc.) and other taxes *less* subsidies on production. It therefore gives a figure for the operating surplus: the surplus (or deficit) on production activities before distributions such as interest, rent and income tax charges have been considered. Hence the operating surplus is the income which units obtain from their own use of the production facilities.

Note that taxes on production and imports are shown as a use by producing sectors in this account but not as a resource of government. This is because they do not relate to productive activity by government and cannot therefore contribute to its operating surplus. They become a resource of government in the allocation of primary income account which follows.

Allocation of primary income account

This account shows the resident units and institutional sectors as recipients rather than producers of primary income. It demonstrates the extent to which operating surpluses are distributed (for example by dividends) to the owners of the enterprises. Also recorded in this account is the property income received by an owner of a financial asset in return for providing funds to, or putting a tangible non-produced asset at the disposal of, another unit. The receipt by government of taxes on production *less* subsidies is shown in resources.

The resources side of the allocation of primary income accounts includes the components of the income approach to measurement of gross domestic product and this is the starting point for the quarterly sector accounts. The accounts also include property income recorded as both resources for receipts and uses for payments.

The balance of this account is the gross balance of primary income (B.5g) for each sector, and if the gross balance of primary income is aggregated across all sectors of the UK economy the result is gross national income.

Secondary distribution of income account

This account describes how the balance of primary income for each institutional sector is allocated by redistribution; through transfers such as taxes on income, social contributions and benefits and other current transfers. It excludes social transfers in kind.

The balancing item of this account is gross disposable income (B.6g) which reflects current transactions and explicitly excludes capital transfers, real holding gains and losses, and the consequences of events such as natural disasters.

Use of disposable income account

This account illustrates how disposable income is split between final consumption expenditure and saving. In the system for recording economic accounts, only the government and the households and Non Profit Institutions Serving Households (NPISH) sectors have final consumption. In addition, for households and pension funds, there is an adjustment item in the account which reflects the way that transactions between households and pension funds are recorded (This adjustment is D.8: Adjustment for the changes in the net equity of households in pension funds reserves).

The balancing item for this account, and thus for this whole group of distribution and use of income accounts, is gross saving (B.8g).

Thus it is only in the case of non-financial corporations (public and private) that undistributed income and saving are equivalent.

Capital account

The capital account is presented in two parts.

The first part shows that saving (B.8g) the balance between national disposable income and final consumption expenditure from the production and distribution and use of income accounts is reduced or increased by the balance of capital transfers (D.9) to provide an amount available for financing investment (in both non-financial and financial assets).

In the second part, total investment in non-financial assets is the sum of gross fixed capital formation (P.51), changes in inventories (P.52), acquisitions /less disposals of valuables (P.53) and acquisitions /less disposals of non-financial non-produced assets (K.2). The balance on the capital account is known as net lending or borrowing. Conceptually this net lending or borrowing for all the domestic sectors represents net lending or borrowing to the rest of the world sector.

Thus, if investment is lower than the amount available for investment, the balance will be positive and is regarded as lending (if negative the balance is borrowing). Where the capital accounts relate to the individual institutional sectors, the net lending/borrowing of a particular sector represents the amounts available for lending or borrowing to other sectors. The value of net lending/borrowing is the same irrespective of whether the accounts are shown before or after deduction of fixed capital consumption (K.1), provided a consistent approach is adopted throughout.

Financial account

The financial account elaborates the acquisition and disposal of financial assets and liabilities. Examples of financial assets include: bank deposits (which are assets of the depositors and liabilities of the banks), unit trust units (assets of the holders and liabilities of unit trusts), and Treasury Bills (assets of the holders and a liability of central government). The balance of all transactions in the financial account is net lending or borrowing.

The statistical adjustment items

Although in theory the net lending/borrowing from the financial account and the net lending/borrowing from the capital account for each sector should be equal, in practice they are not. This is because of the (sometimes substantial) errors and omissions in the accounts. The difference between the two balances is known as the statistical adjustment item.

Part of the balancing process for the economic accounts statistics for years before the latest one shown (that is, for years $t - 1$ and earlier) involves assessing and modifying the component variables so that the estimates of net lending/borrowing made from the income and capital accounts, and from the financial accounts, are the same at the level of the whole economy, and reasonably close to each other at the sector level.

The sectoral statistical adjustment items are shown in Table D below. They provide a measure of the reliability of the accounts.

D Table D: Sector statistical adjustment

Total ¹	-RVFE	-	-	-	-	-	-	-	-	-253

¹ Equals, but opposite in sign to, the residual error observed between GDP measured by the income approach and GDP measured by the expenditure approach

Balance sheets

A financial balance sheet for each sector has been compiled using the same financial instrument classification as that used for financial transactions. The changes in the end period levels in the financial balance sheets do not equal the financial transactions because of holding gains or losses and reclassifications of units between sectors. Non-financial balance sheets for the ESA95 sectors are now included.

1 "Purpose" or "function" classifications are designed to indicate the "socio-economic objectives" that institutional units aim to achieve through various kinds of outlays. COICOP is the Classification of Individual Consumption by Purpose and applies to households. COPNI is the Classification of the Purposes of Non-profit Institutions Serving Households and COFOG the Classification of the Functions of Government. The introduction of ESA95 coincides with the redefinition of these classifications and data will be available on a consistent basis for all European Union member states.

2 Package holidays data are dispersed between components (transport etc)

An aerial, high-angle photograph of a crowded public space, likely a transit station or a busy pedestrian walkway. The floor is made of large, light-colored rectangular tiles. Numerous people are seen from above, walking in various directions. Some are carrying bags or backpacks. In the upper right, there are metal railings and structural elements of a building or platform. The overall scene is busy and populated.

Chapter 10

Non-financial balance sheets

The non-financial balance sheets show the market value of non-financial assets in the UK. As such are a measure of the wealth of the UK.

When financial assets are added to the value of the non-financial assets, the result, the net worth of the UK, is estimated at £6,669 billion in 2009. This is a decrease of £94 billion on the previous year. The non-financial balance sheets figures also show that the most valuable asset continues to be housing with a total value of £4,048 billion in 2009. This is up 3 per cent on the previous year and equivalent to 61 per cent of the nation's total wealth. The housing stock belonging to the household and non-profit organisations sector was worth £3,827 billion, up 4 per cent on the previous year.

Non-financial assets include both tangible and intangible assets. Tangible assets consist of property: plant and machinery; agricultural assets; vehicles; and also include certain types of farming stocks (mainly dairy cattle and orchards) and military equipment whose use is not solely destructive. Intangible assets consist of the value of computer software, patents, mineral exploration and artistic originals.

Data sources include:

- other government departments and agencies
- annual reports of public corporations and major businesses

- industry publications
- Chartered Institute of Public Finance and Accountancy report on Local Authority Assets

Where non-financial asset market valuations are not readily available, a proxy is used based on the UK net capital stocks data modelled in the PIM within the Office for National Statistics. For central government data are taken from returns made by government departments to HM Treasury. Central government assets also include the value of the electro-magnetic spectrum. The spectrum is treated as a tangible non-produced asset and the payments made by mobile phone companies as rent.

Local authority housing is shown in the public corporations sector. This is because government-owned market activities are always treated as being carried out by public corporations, either in their own right or via quasi-corporations.

Revisions in the data are due to ongoing improvements in the non-financial balance sheets compilation process, started in 2005, which were continued during the year; the most prominent of these are agriculture and commercial, industrial, and other buildings. Revisions to the financial accounts and balance sheets for this publication have also been incorporated into the overall values for net worth.

1 Net worth was previously defined as *net wealth*.

2 Following the grant of licences to mobile phone companies, the electro-magnetic spectrum is included as an asset for the first time in 2000.

Chapter 11

Public sector supplementary tables

Introduction

The Government's fiscal policy rules rely on statistical measures based on the National Accounts framework. The speed with which revisions could be taken on in the National Accounts is not adequate for the purposes of fiscal policy, which is based on an economic cycle and requires up-to-date information over the entire cycle. This has led to a separate revisions policy for the *Public Sector Finances*¹, where revisions are immediately implemented, with the National Accounts catching up as soon as possible.

As a consequence of these different revisions policies, the version of Chapter 11 published here is consistent with the National Accounts, but not with the *Public Sector Finances*¹.

Table 11.2 (functional breakdown of General Government) was withdrawn from the ONS *Blue Book* in 2007 as the majority of the data in this table, with consistent time series, are published elsewhere by ONS within ESA Table 11².

Table 11.3 (key fiscal aggregates) was also withdrawn from the ONS *Blue Book* in 2007. The bulk of the data in this table are published in the *Public Sector Finances*¹. These data are more up to date than is possible in a National Accounts publication as the *Public Sector Finances*¹ are not subject to the National Accounts revision policy (see above).

Tables 11.4 and 11.5 (reconciliation of financial balance sheets and transactions for the General Government sector and the Central and Local Government sub-sectors) and Table 11.7 (housing operating account) were withdrawn from the ONS *Blue Book* in 2008. Table 11.6 was withdrawn from the ONS *Blue Book* in 2009.

Taxes payable by UK residents (Table 11.1)

This table is consistent with the National Accounts. The table shows the taxes and national insurance contributions payable

to central government, local government, and to the institutions of the European Union.

Taxes on production are included in GDP at market prices. Taxes on products are taxes levied on the sale of goods and services. Other taxes on production include taxes levied on inputs to production (for example non-domestic rates by businesses) and some compulsory unrequited levies that producers have to pay.

Taxes on income and wealth include income tax and corporation tax. Also included are some charges payable by households (for example local government taxes and motor vehicle duty), which are classified as taxes on production when payable by businesses. The totals are measured gross of any tax credits and reliefs recorded as expenditure in the National Accounts, such as working families and child tax credit.

The European System of Accounts 1995 (ESA95) has a category called compulsory social contributions. In the UK accounts this category includes all national insurance contributions. Details of total social contributions and benefits are shown in Tables 5.2.4S and 5.3.4S of Chapter 5.

Some UK taxes are recorded as the resources of the European Union. These include taxes on imports and an amount calculated as the hypothetical yield from VAT at a standard rate on a harmonised base across the EU.

Chapter 12

Statistics for European Union purposes

The European Union uses National Accounts data for a number of administrative and economic purposes. Gross National Product (GNP), calculated in accordance with the European System of Accounts 1979 (ESA79), has been used in setting a ceiling on the EU budget and calculating part of Member States' contributions to the budget.

However from 2002, the calculation reflects the move to the new European System of Accounts 1995 (ESA95) and the progression to Gross National Income (GNI) from GNP.¹ ESA95 is the basis on which most UK statistical information is now supplied to the EU.

ESA95 differs from the ESA79 in a number of ways; for example, the recording of interest payments and the treatment of software in gross fixed capital formation, and roads and bridges in the consumption of fixed capital formation.²

Data supplied for EU budgetary purposes

The GNP/GNI measure³ is one component in the calculation of Member States' contributions to the EU Budget.

GNP data up to and including 2001 have been frozen, or 'closed' in the calculation of UK contributions. In future, revisions will only be made due to methodological improvements to the transition mechanism (see note 2).

The years 2002 onwards remain 'open' years, reflecting any revisions to National Accounts. From 2002, UK contributions are calculated under the ESA95 framework as shown in Table 1.2.

UK transactions with the institutions of the EU

Table 12.1 shows the UK contribution to the budget under the four categories of revenue raising ('own resources'), and payments flowing into the UK in the form of EU expenditure and the UK budgetary rebate. UK GNP/GNI forms the basis of the 'Fourth Resource' contributions.

Data to monitor government deficit and debt

The convergence criteria for Economic and Monetary Union (EMU) are set out in the 1992 Treaty on European Union (The Maastricht Treaty).⁴ The Treaty, plus the Stability and Growth Pact, requires Member States to avoid excessive government deficits – defined as general government net borrowing and

gross debt as a percentage of GDP. Member States report their planned and actual deficits, and the levels of their debt, to the European Commission. Data to monitor excessive deficits are supplied in accordance with EU legislation.⁵

The Treaty does not determine what constitutes 'excessive'. This is agreed by the Economic and Finance Council (ECOFIN). However, a Protocol to the Treaty does provide a reference value of 3 per cent of GDP for net borrowing and 60 per cent of GDP for gross debt.

The United Kingdom submitted the estimates in the following table to the European Commission in March 2010.⁶

	2005/06	2006/07	2007/08	2008/09
General government deficit				
net borrowing (£bn)	38.7	35.0	38.4	96.8
as a percentage of GDP ⁶	3.0	2.6	2.7	6.7
General government debt				
debt at nominal value (£bn) ⁷	535.3	577.9	620.1	800.1
as a percentage of GDP ⁶	42.1	42.9	43.7	55.8

5 Before 1999 these have been included in Agricultural guarantee fund payments (series EBGL).

UK Environmental Accounts

Part 5

Chapter 13

The UK Environmental Accounts at a glance

Oil and gas reserves

Proven oil reserves (remaining) at the end of 2008 were 408 million tonnes, 44 million tonnes less than at the end of 2007. After accounting for production of 72 million tonnes in 2008, there has been a net transfer of 28 million tonnes from probable to proven oil reserves.

Proven gas reserves were also lower at 292 billion cubic metres (bcm) in 2008 compared with 343 bcm a year earlier. Levels of gas extraction stood at 68 bcm in 2008, the lowest since 1994.

Estimated remaining recoverable oil reserves at end of year, 1998–2008

Source: ONS

Energy consumption

Energy consumption, including electricity, by UK companies and the public sector (excluding households) increased by 1.1 per cent between 1990 and 2008, while output (Gross Domestic Product) rose by 54.1 per cent in real terms. As a result, energy intensity (energy consumed per unit of output) has decreased by 34.4 per cent over the same period. The percentage of energy derived from renewable sources was 2.1 per cent in 2008 compared with 0.8 per cent in 1990.

Non-domestic energy consumption and output (Gross Domestic Product, CVM), 1990–2008

Source: ONS

Atmospheric emissions

Total greenhouse gas emissions on a National Accounts basis have fallen by 13.6 per cent since 1990, driven by a 17.6 per cent reduction in emissions from UK companies and the public sector. In contrast, emissions from the household sector have risen by 5.5 per cent between 1990 and 2008. There was a small increase in 2008 (0.2 per cent) following three years of falling emissions due to an increase in energy consumed for domestic heating purposes.

Between 1990 and 2008, the largest falls in greenhouse gas emissions occurred in other services (52.4 per cent) and manufacturing (38.2 per cent). The largest increase was in transport and communications, up 45.4 per cent.

Emissions of the chemicals that cause acid rain have fallen by 62.5 per cent since 1990. Over this period there have been

Atmospheric emissions of greenhouse gases and acid rain precursors, percentage change, 1990–2008

Source: ONS

reductions in all industries with the exception of transport and communications sector which saw an increase of 2.4 per cent. Emissions from households were 60.9 per cent lower in 2008 than in 1990, mainly reflecting falling emissions from the use of vehicles as a result of cleaner technology.

The first signs of the economic downturn were seen in 2008, but the decrease in emissions intensity indicates that the overall fall in greenhouse emissions was not wholly driven by reduced economic growth. Emissions intensity has continued to improve across the non-household sector and greenhouse gas emissions per unit of output in 2008 were 43.9 per cent below those in 1990. Greenhouse gas emissions per unit of output over this period fell 37.3 per cent in electricity, gas and water supply; 40.8 per cent in manufacturing; 31.8 per cent in transport and communications; and 17.6 per cent in agriculture. These four sectors account for approximately 80 per cent of greenhouse gas emissions from the non-household sector.

Material flow accounting

Material productivity has increased 87.4 per cent between 1990 and 2008. This trend indicates that material use is falling, in relation to the level of economic activity in the UK, and supports evidence that domestic material use and economic growth have decoupled since 1990. However, levels of imports have generally risen over the same period suggesting that some of the environmental impacts associated with consumption are being transferred abroad.

Environmental taxes

In 2009 environmental tax receipts amounted to £39.5 billion. By far the largest contributor to environmental taxes is duty on hydrocarbon oils such as petrol and diesel. This accounted for 65.6 per cent of the total in 2009, where receipts increased by approximately £1.1 billion compared with the previous year.

In 2009 the percentage of total taxes and social contributions which environmental taxes represent increased from 7.2 per cent to 8.1 per cent, reflecting both the rise in environmental tax receipts and a fall in total tax revenues. Environmental taxes were 2.8 per cent of Gross Domestic Product in 2009.

Table 13.8 contains a breakdown of these taxes by 13 industries for 2008. This shows that UK households pay £20.9 billion in environmental taxes, over half of all environmental taxes and more than three times the next highest contributor, the transport and communications industry.

Greenhouse gas emissions per unit of output, (Gross value added CVM), 1990–2008

Material flows in the UK

Government receipts from environmental taxes 1993–2009

Environmental protection expenditure

In 2004 public sector environmental protection expenditure was estimated at £5.9 billion.

Environmental protection expenditure data by industry for 2007, published by the Department for Environment, Food and Rural Affairs (Defra), is also included in this chapter.

Public sector environmental protection expenditure, 2001–2004

UK Environmental Accounts

Environmental accounts are ‘satellite accounts’ to the main National Accounts. Satellite accounts are extensions to the National Accounts, which facilitate analysis of the wider impact of economic change. Environmental accounts provide information on the environmental impact of economic activity (in particular on the emissions of pollutants) and on the importance of natural resources to the economy. Environmental accounts use similar concepts and classifications of industries to those employed in the National Accounts, and they reflect the recommended European Union and United Nations frameworks for developing such accounts.

The accounts are used to inform sustainable development policy, to model impacts of fiscal or monetary measures and to evaluate the environmental performance of different industrial sectors.

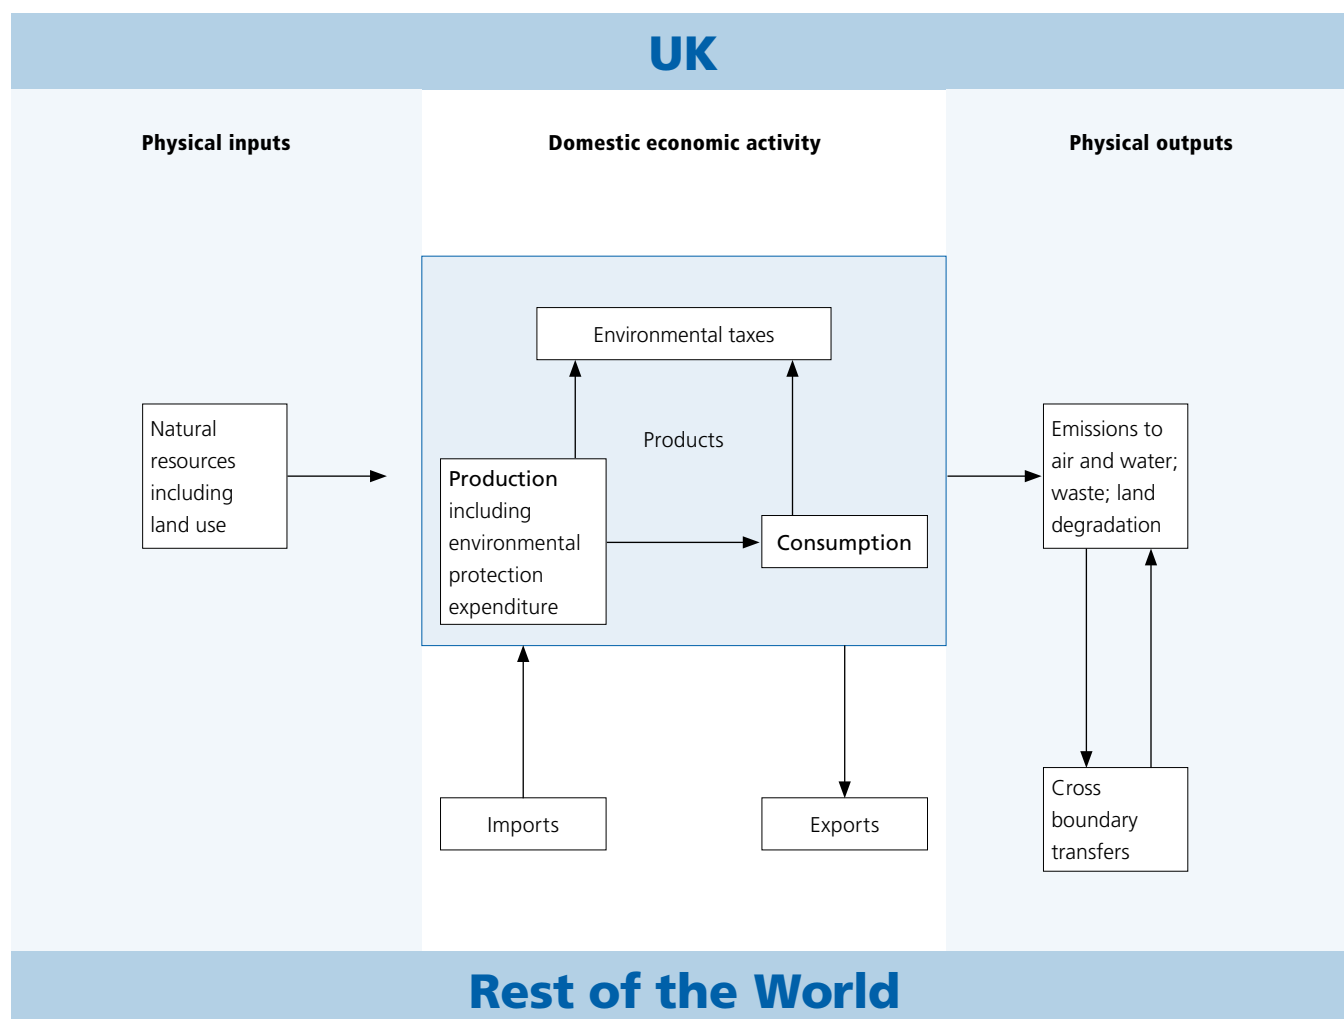

Most data are provided in units of physical measurement (volume or mass), although where appropriate some accounts are shown in monetary units.

This chapter includes information previously published in the 2010 edition of *Environmental Accounts*¹ and updates information on environmental taxes. More detailed information on each of these accounts is available in *UK Environmental Accounts* on the ONS website:

www.statistics.gov.uk/statbase/Product.asp?vlnk=3698

The diagram below shows how the areas covered by environmental accounts relate to the economy as described by the National Accounts.

Environment and economy interactions

Oil and gas reserves (Tables 13.1 and 13.2)

Definition of oil and gas

Oil reserves include both oil and the liquids and liquefied products obtained from gas fields, gas-condensate fields and from the associated gas in oil fields. Gas reserves are the quantity of gas expected to be available for sale from dry gas fields, gas-condensate fields and oil fields with associated gas. Gas which is expected to be flared or used offshore is not included.

This publication uses terminology introduced by the Department for Energy and Climate Change (DECC) to describe UK reserves of oil and gas.² Descriptions are now more closely aligned to those used by the oil and gas industry in order to improve general understanding and ensure consistency. Reserves are classified into the following categories: reserves, potential additional reserves and undiscovered resources. Undiscovered resources relate to those resources as yet undiscovered but potentially recoverable in mapped leads. Potential additional reserves are defined as discovered reserves that are not currently technically or economically producible. Reserves are classified as discovered, remaining reserves which are recoverable and commercial. These can be subdivided into proven, probable or possible depending on confidence level.

Simulation models using Monte Carlo techniques have been used each year by DECC to assess the likely existence and size of undiscovered oil and gas fields on the UK Continental Shelf (UKCS). The assessments are presented as ranges, but the limits of the ranges should not be regarded as maxima or minima. Estimates of the volume of undiscovered reserves have fluctuated considerably in recent years as new areas of UKCS have been subjected to statistical analysis and older areas have been re-assessed.

The lower end of the range of total reserves shown in the table is the sum of estimated proven reserves and the lower end of the range of undiscovered resources for that year, net of cumulative production.

The upper end of the range of total reserves is the sum of estimated proven, possible and probable reserves, plus the upper-end range of undiscovered resources, for that year, net of cumulative production.

The expected level of reserves is calculated as the sum of proven and probable reserves and the lower end of the range of undiscovered resources.

Other volume changes are calculated as the difference between the expected level of reserves at the start of the year, less production within that year, and the estimated level of reserves at the start of the following year.

Monetary valuation of oil and gas reserves

Please note: The methodology for the valuation of oil and gas reserves is under review. This table has therefore not been updated in line with the physical accounts. The monetary accounts will be updated at the earliest opportunity.

Expressing UK oil and gas reserves in monetary terms allows these subsoil assets to be compared with other economic entities. This provides a means for the commercial depletion of subsoil assets to be set against national income. Results are presented in Table 13.2 in the form of a balance sheet.

Since observed market values for transactions *in situ* in their original state are not widely available, the present value method is used to put a monetary value on the physical stocks of assets. This is an indirect valuation method measuring the current value of the asset's future streams of income by discounting the expected future rent, often referred to as the economic rent or resource rent. This method relies on information about the size of resource rent, the number of years for which the rent is to be received and the social discount rate to be applied.

The resource rent is the net income from extraction defined as total revenue from sales less all costs incurred in the extraction process, that is operating costs, depreciation of capital and an allowance for the return on capital. Decommissioning costs have not been included in these accounts. The rate of return on capital is estimated to be 8 per cent in real terms, in line with Eurostat recommendations³, but it is worth noting that the resulting valuations are very sensitive to variations in this estimate. A three-point centred moving average is used for the calculation of the unit resource rent.

The time span until the complete exhaustion of the reserves is the period over which resource rents are discounted, using the Eurostat recommended social discount rate of 4 per cent. Using these assumptions it is possible to calculate a present value of the stocks of oil and gas reserves at the start and end of each year. The accumulation account then breaks down the change between the start-of-year balance and the end-of-year balance. While physical stocks may change only as a result of extraction and other volume changes such as reassessments, monetary stocks can change for a number of other reasons

Extraction is equal to the total resource rent for the year, effectively reducing the present value of the stocks by that amount. Positive values for extraction are a result of estimated negative resource rents. Revaluation due to time passing takes account of the fact that, as we move forward in time, the period over which the future rents are discounted is one year less, thereby reducing the effect of discounting future incomes. Other volume changes are reassessments which change the estimated physical stock of recoverable reserves.

The change in the extraction path sets out in monetary terms the addition or subtraction to the present value arising from a change in the amounts assumed to be extracted each year.

The change in unit rent gives the change in the future stream of income resulting from a change in the estimated unit resource rent. Any negative stock values result from estimated negative resource rents and have been left in the table in order to show the results of the assumptions made in the calculation.

Energy consumption (Table 13.3)

The Energy Consumption dataset gives estimates of total energy used by each industry and the proportion of total energy used from renewable resources. Detailed estimates of consumption of different fuel types by each sub-sector are given on the ONS website:

[www.statistics.gov.uk/statbase/Expodata/ Spreadsheets/ D5542.xls](http://www.statistics.gov.uk/statbase/Expodata/Spreadsheets/D5542.xls)

Unit of measurement

The unit of measurement is tonne of oil equivalent (toe), which enables different fuels to be compared and aggregated. It should be regarded as a measure of energy content rather than a physical quantity. Standard conversion factors for each type of fuel are given in the *Digest of UK Energy Statistics* (DUKES)⁴.

Consumption of carbon fuels, energy used in transformation processes and losses in distribution

The consumption of carbon fuels, and the related consumption of energy, can be analysed from a number of different perspectives. In terms of atmospheric emissions, it may be helpful to identify which sectors are actually consuming the carbon fuels that give rise to emissions. From this perspective, fuels used by the electricity generation sector are attributed entirely to that sector, even though some of the energy is transformed into electricity. This analysis is shown in Part 1 of the table showing Energy Consumption.

In terms of energy consumption, it is possible to attribute energy used during the process of transformation into electricity, and the energy lost in distributing electricity to end users, either **directly** to the electricity generation sector, or **indirectly** to the consumers of energy. Parts 2 and 3 of the table in Energy Consumption consider energy consumption from both points of view. Part 2 allocates the consumption of energy directly to the immediate consumer of the energy, while Part 3 allocates these 'electricity overheads' of the major power producers to the user of the electricity.

Non-energy uses of fuels

Non-energy use of fuels includes, for example, chemical

feedstocks, solvents, lubricants and road-making material. These uses have been excluded from the data.

Renewable energy sources

Renewable energy is defined to include solar power, energy from wind, wave and tide, hydroelectricity, and energy from wood, straw and sewage gas. Landfill gas and municipal solid waste combustion have been included with renewable energy for the purposes of defining energy sources in the context of sustainable development policy.

Sources and methods for estimating consumption of energy by industrial sector

Data for estimating fuel consumption by industrial sectors are collected by DECC and are published in DUKES. However, the figures shown in Energy Consumption differ from those given in DUKES in that:

- Fuels used by the UK fishing fleet, UK international shipping and aircraft operators, and ships and aircraft used for UK military purposes are included, whether or not they were purchased in the UK, whereas fuels purchased in the UK by non-resident operators are excluded
- Purchases of petrol and diesel abroad by UK motorists and road hauliers are included
- Non-energy uses of fuels for example, chemical feedstocks, solvents, lubricants and road-making material, are excluded. However, energy lost through gas leakage etc is included
- The classification of industrial sectors used in environmental accounts differs from that used in DUKES. In particular, the transport sector is defined to include only enterprises that provide transport services to other consumers (that is, public transport operators, freight haulage companies, etc). The energy consumed by households' use of private cars is allocated to the domestic sector.

The allocation of energy use to particular industries is primarily based on DUKES data. However, for certain industries better estimates are used as published by DECC in *Energy Trends*. Differences in publication times may result in minor reconciliation anomalies between ONS and DECC energy data.

Atmospheric emissions (Tables 13.4 and 13.5)

Tables 13.4 and 13.5 give estimates of pollutants directly emitted to the atmosphere by each sector. The figures are on a National Accounts basis and differ from the basis used to monitor progress against the Kyoto Protocol in that they include estimated emissions from fuels purchased abroad by UK residents⁵, including those used by international shipping and aircraft on international flights. Emissions from fuels purchased in the UK by non-UK residents are excluded.

Detailed estimates of pollutants from each sub-sector are given on the ONS website:

www.statistics.gov.uk/statbase/Expodata/Spreadsheets/D5540.xls

The website also gives details of emissions from acid rain precursors such as Sulphur Dioxide, other pollutants like Benzene and heavy metals including Lead and Zinc.

Pollutants and environmental themes

Atmospheric emissions can be aggregated according to their contribution to environmental themes such as greenhouse gases and acid rain. A description of the pollutants covered and the methodology used to calculate environmental themes is given in the annex to these notes.

Attributing emissions to industrial sectors

The disaggregation of national estimates of emissions to industrial sectors is based upon an initial disaggregation provided by the National Environmental Technology Centre (AEA Energy and Environment)⁶ which maintains the National Atmospheric Emissions Inventory (NAEI)⁷. Emissions are estimated by multiplying fuel consumption by emissions factors and adding releases unrelated to fuel use such as methane arising from landfill.

The NAEI data is used to identify the main processes and industries responsible for the emissions, which are then allocated to individual sectors on the basis of information from a variety of sources. For example, emissions from diesel use by Heavy Goods Vehicles are allocated to sectors using vehicle mileage data from the Department for Transport. Expenditure information is also used, for example to allocate emissions arising from the use of various industrial coatings (for example, general industrial, heavy duty and vehicle refinishing) to relevant sectors in proportion to each sector's expenditure on paints, varnishes and similar coatings, printing ink and mastics, using the National Accounts supply-use tables as the main source. A full description of the methods and sources used in these accounts is available on request from the ONS Environmental Accounts branch.

There are a number of formats for the reporting and recording of atmospheric emissions data. These include the Intergovernmental Panel on Climate Change (IPCC) and United Nations Economic Commission for Europe (UNECE) measures both published by Defra and the National Accounts consistent measure published by ONS. For further details please refer to *Environmental Accounts* on the National Statistics website.

Table 13.4, shows latest estimates of air pollutants directly emitted by each sector. Emissions generated by the electricity supply industry have not been reallocated to their customers in

this analysis. Emissions from road haulage are given on an 'own account' basis, that is, attributed to the sector owning the transport rather than to the sector of the goods being transported. Similarly emissions from households' use of private cars are allocated to the domestic sector. Figures for total road transport emissions are provided separately.

Table 13.5 shows estimates of greenhouse gases and acid rain emissions by industrial sector.

Material flows (Table 13.6)

Material flow accounts record the total mass of natural resources and products that are used by the economy, either directly in the production and distribution of products and services, or indirectly through the movement of materials which are displaced in order for production to take place.

A material flow account balances the inputs (extraction of natural resources from the UK environment, and imports of goods) with the outputs (wastes, emissions to air and water, exports) and accumulation (in terms of new buildings, etc) within the economy.

The direct input of materials into the economy derives primarily from domestic extraction, that is, from biomass (agricultural harvest, timber, fish and animal grazing); fossil fuel extraction (such as coal, crude oil and natural gas) and mineral extraction (metal ores, industrial minerals such as pottery clay; and construction material such as crushed rock, sand and gravel).

The direct input of materials from domestic sources is supplemented by the imports of products, which may be of raw materials such as unprocessed agricultural products, but can also be semi-manufactured or finished products. In a similar way the UK exports of raw materials, semi-manufactured and finished goods can be viewed as inputs to the production and consumption of overseas economies.

Water is used so widely and in such quantities that its inclusion in the accounts tends to obscure other resource use. For this reason, the accounts only include the water that is contained in products (for example, agricultural produce and imported beverages). Water for other consumptive uses (cleaning or irrigation) and *in situ* uses (such as hydroelectric power) is excluded from these accounts.

Hidden flows measure the quantity of material displaced by the process of extraction but not actually used in the production of goods and services. Indirect flows measure the quantity of material associated with imports of raw and semi-processed goods into the UK. Both hidden and indirect flows are measured indirectly by applying coefficients for particular materials and goods to the estimated levels of mass associated with domestic and overseas extraction. Therefore, there is a direct relationship between hidden flows and actual extraction.

Levels are sensitive to assumptions embodied in the particular hidden or indirect flow coefficient used. Examples of hidden flows are unused extraction from mining and quarrying (also known as overburden); discarded material from harvesting (for example, wood harvesting losses such as timber felled but left in the forests); and soil and rock moved as a result of construction and dredging.

Indicators

There are a number of indicators which can be used to summarise the flows of materials into and out of the economy. Material flows show three of the main indicators used to measure inputs.

Direct Material Input (DMI) measures the input of materials directly used by the economy. It is the sum of domestic extraction and imports.

Domestic material consumption (DMC) measures the total amount of material directly consumed by the economy. It is the sum of domestic extraction and imports *less* exports.

The **Total Material Requirement (TMR)** measures the total material basis of the economy, that is the total direct and indirect resource requirements of all the production and consumption activities. TMR includes the amount of used extraction in the UK, the imports into the UK and the resulting indirect or hidden flows associated with extraction in the UK and imports from other countries. Although TMR is widely favoured as a resource use indicator, the estimates of indirect flows are less reliable than those for materials directly used by the economy, and it can be argued that it double-counts trade flows, in that materials used both in the production of imports and in the production of exports are included. The indicator therefore needs to be considered alongside other indicators.

The **Physical Trade Balance (PTB)** measures the difference between the total mass of exports and the total mass of imports. This can be used to understand the internal relationship of material use in the UK.

Sources and methods

Data on the yields of agriculture, forestry and fishing come from the Food and Agriculture Organization (FAO)⁸. Mineral extraction data have been taken from the UK Minerals Yearbook⁹ and information on the mass of imports and exports has been taken from trade information compiled by HM Revenue and Customs¹⁰.

Factors applied to give estimates of the amounts of unused material moved for each tonne of used material have been taken from research carried out by the Wuppertal Institute on behalf of the Department for Environment, Food and Rural Affairs (Defra)¹¹. The methodology used to compile the account is also based upon the Wuppertal Institute's research.

Government revenues from environmental taxes (Table 13.7)

The environmental taxes table shows the level of revenues raised in environmental taxes in the United Kingdom.

Definition of an environmental tax

An environmental tax is defined as a tax whose base is a physical unit such as a litre of petrol, or a proxy for it, for instance a passenger flight, that has a proven specific negative impact on the environment. By convention, in addition to pollution related taxes, all energy and transport taxes are classified as environmental taxes. This definition has been agreed by international experts and adopted by the Statistical Office of the European Communities (Eurostat) and Organisation for Economic Co-operation and Development (OECD). It enables analysis to be based on the **effects** of taxes rather than the aims behind their introduction: that is, the aim of a tax for raising government revenue rather than reducing environmental degradation does not preclude it from being defined as an environmental tax.

Nevertheless, the interpretation and use of measures of environmental taxes need care. In particular, the levels of revenues from environmental taxes do not necessarily indicate the relative importance or the success of environmental policy. High environmental tax revenues can result either from high rates of taxes or from high levels of environmental problems (for example, pollution) leading to a large tax base. The broad measure of revenues can also fail to capture the effect of the differential rates that encourage a shift away from higher impact behaviour (such as the use of leaded petrol).

Taxes on energy products include duties on hydrocarbon oils used in road vehicles, the main ones being ultra low sulphur petrol and ultra low sulphur diesel.

VAT on duty is calculated as a fixed proportion, in most cases 17.5 per cent of the duty paid on hydrocarbon oils. In practice much of this VAT will be reclaimed by business, but it could be argued that the total will eventually be paid when the final product or service is purchased.

Taxes on energy products also include those used for non-transport purposes (such as industrial gas turbines and heating installations, with a reduced rate for energy saving materials). The fossil fuel levy was levied on sales of electricity from fossil fuels and was used to compensate companies producing electricity from non-fossil fuel sources such as nuclear or renewable energy.

Renewable energy obligations work by placing an obligation on licensed electricity suppliers to source a specified and annually increasing proportion of their electricity sales from renewable sources or pay a penalty. The Renewables

Obligation (RO) is the current main mechanism for supporting large scale generation of renewable electricity.

The **climate change levy**, which is a tax on non-domestic use of energy, was introduced in April 2001. The levy applies to the suppliers of the following energy types: electricity, natural gas as supplied by a gas utility, petroleum and hydrocarbon gas in a liquid state, coal and lignite, coke and seem-coke of coal or lignite, and petroleum coke. The rates of the levy are based on the type and quantity of fuel supplied, with a range of relief and exemptions available.

Taxes on road vehicles include Vehicle Excise Duty, which keepers of motor vehicles can pay on either a six-monthly or annual basis. There have been various changes to this duty over recent years. As from 1 May 2002, private cars, taxis and light goods vehicles registered before 1 March 2001 with an engine size up to and including 1549cc are subject to a lower tax than cars with engine sizes greater than 1549cc. The same vehicle types registered on or after 1 March 2001 are taxed according to the level of carbon dioxide emissions. This is now presented broken down by payments from businesses and households. Car tax was payable on purchases of new cars up until 1993 when it was discontinued.

Air passenger duty was introduced on 1 November 1994. It applies to the carriage from a UK airport of chargeable passengers on chargeable aircraft and is applied at different rates. The latest rates are outlined on the HM Revenue and Customs website:

www.hmrc.gov.uk/budget2010/bn59.pdf

Landfill tax was introduced in October 1996 and aims to encourage waste producers to produce less waste; recover more value from waste, for example, through recycling or composting; and to use more environmentally friendly methods of waste disposal. The tax applies to active and inactive (inert) waste disposed of at landfill sites. Generally when waste is committed to landfill it undergoes physical chemical or biological transformations which then react with surrounding matter. Known as leaching, this process can give rise to environmental damage and harm human health. Waste classified as inactive has insignificant levels of leachability, pollutant content and ecotoxicity. Types of waste excluded from this tax include dredgings, disposals from mines and quarries, and also waste resulting from the clearance of contaminated land. A standard rate of tax is levied on active waste, and a lower rate is levied on inert waste. The following link gives further information:

www.hmrc.gov.uk/budget2007/bn61.htm

The **aggregates levy** was introduced on 1 April 2002. The objective of this tax is to address the environmental costs

associated with quarrying operations (noise, dust, visual intrusion, loss of amenity and loss to biodiversity), by reducing the demand for aggregate and encouraging the use of alternative materials where possible, for example, the use of waste glass and tyres in aggregate mixes. The tax applies to the commercial exploitation of sand, gravel and rock and includes aggregate dredged from the seabed within UK territorial waters. It is a specific tax, charged at £1.95 per tonne. The following link gives further information:

http://customs.hmrc.gov.uk/channelsPortalWebApp/channelsPortalWebApp.portal?_nfpb=true&_pageLabel=pageExcise_RatesCodesTools&propertyType=document&id=HMCE_PROD1_027234

There is a wide range of exemptions for some quarried or mined products, for example, coal, metal ores, industrial minerals and for minerals used in the production of lime and cement and for exports of aggregates. Imports of aggregates are taxed upon first sale or use in the UK.

Environmental taxes breakdown by 13 industries (Table 13.8)

The environmental taxes breakdown by 13 industries is based on general government environmental taxes data and unpublished Supply-Use data for taxes on products and production that are informed by latest available Supply-Use tables. From these sources it is possible to estimate allocations of environmental taxes to individual industries. A more detailed account of the methods used in this analysis is published in the August 2004 and October 2006 editions of *Economic Trends*¹⁶.

Environmental protection expenditure (Tables 13.9 and 13.10)

Estimates of environmental protection expenditure should be regarded as approximate orders of magnitude only. Because of this qualification, the estimates shown fall outside the scope of National Statistics.

Comparisons with previous surveys

The information on spending by industries in 2007, which is summarised in environmental protection expenditure in specified industries, 2007 comes from a regular series of surveys conducted by the URS Corporation on behalf of Defra. The estimates from this survey and the earlier surveys should be regarded as very approximate and any comparisons between the results should be treated with care.

Definition of expenditure

Environmental protection expenditure is defined as capital and operational expenditure incurred because of, and which can be directly related to, the pursuit of an environmental objective.

Spending on installations and processes which are environmentally beneficial, but which also produce revenue (or savings) exceeding expenditures, are excluded on the grounds that they are likely to have been carried out for commercial not environmental reasons. Also excluded are expenditures on natural resource management (for example, fisheries and water resources), on the prevention of natural hazards (for example, flood defence), on the provision of access and amenities to National Parks etc, and on the urban environment. The spending has been classified by the following groups of environmental concerns:

- Protection of ambient air and climate
- Waste water management
- Waste management
- Protection of biodiversity and landscapes
- Other abatement activities such as on the protection of soil and groundwater, protection against radiation, and noise and vibration abatement
- Other environmental expenditure, on research and development, education and administration

The spending shown in 2004 public sector environmental protection expenditure has also been classified by the following types of expenditure:

- current costs, including staff costs (compensation of employees), other on-going expenditure on purchases of goods and services, and the estimated consumption of fixed capital
- capital expenditure or investment including outlays on land and on the additions of new durable goods to the stock of fixed assets for environmental protection
- income from sales, fees, and charges for the provision of current or capital goods and services, such as fees for waste removal, but excluding taxes
- current and capital transfers to other sectors of the economy
- net transfers to and from the Rest of the World, in the form of aid or other grants, net of grants received from the EU

There are five main categories of spending in environmental protection expenditure by specified industries:

- End-of-pipe=investment is defined as add-on installations and equipment which treats or controls emissions or reduces waste material generated by the plant, but which does not affect production processes
- Integrated processes are adaptations or changes to production processes in order to generate fewer emissions or waste materials

- In-house operating expenses cover operating costs necessary to run end-of-pipe or integrated facilities
- Current payments made to others include all payments to third parties for environmental services, including payments for the treatment or removal of solid waste; water service company charges for sewage treatment; payments to contractors for the removal or treatment of waste waters; and payments made to environmental regulatory authorities
- Research and development expenditure includes both in-house research and development and amounts paid to others such as trade associations and consultants.

Sources

Environmental protection expenditure in specified industries gives figures for spending by the extraction, manufacturing, energy production and water supply industries. They are drawn from a survey for 2007 carried out on behalf of the Department for Environment, Food and Rural Affairs (Defra) by URS Corporation Ltd.

Environmental protection expenditure by the public sector gives estimates for expenditures by the public sector and is based on information obtained from a variety of sources such as the public expenditure database and from various government departments, local authorities and the devolved administrations.

Data for industry and public sector environmental protection expenditure should not be added together as differing classification procedures make comparisons problematic.

Annex: Atmospheric pollutants and environmental themes

Greenhouse gases

There is a growing consensus that the rise in concentrations of greenhouse gases in the atmosphere has led to changes in the global climate system. The greenhouse gases included in the atmospheric emissions accounts are those covered by the Kyoto Protocol: carbon dioxide (CO₂), methane (CH₄), nitrous oxide (N₂O), hydrofluorocarbons (HFCs), perfluorocarbons (PFCs) and sulphur hexafluoride (SF₆).

Carbon dioxide (CO₂) emissions mainly come from the combustion of fossil fuels, but it is also produced in some industrial processes such as the manufacture of cement. Carbon dioxide is a long-lived gas remaining in the atmosphere for between 50 and 200 years. It is the main anthropogenic greenhouse gas.

Methane (CH₄) is produced when organic matter is broken down in the absence of oxygen. Large quantities are produced by enteric fermentation in cattle and sheep, by the spreading of animal manure, and from organic waste deposited in landfill

sites. Methane is also emitted in coal mining, oil and gas extraction and gas distribution activities. Methane is a significant greenhouse gas.

Nitrous oxide (N₂O) is released in a few industrial processes and from the soil when nitrogenous fertilisers are applied in agriculture and horticulture. These are the main human sources. It is a long-lived pollutant, lasting about 120 years in the atmosphere and is a potent greenhouse gas.

Hydrofluorocarbons (HFCs), perfluorocarbons (PFCs) and sulphur hexafluoride (SF₆) are artificial fluids that contain chlorine and/or fluorine. Because of their low reactivity and non-toxicity they were widely used as refrigerants, foam blowing agents, aerosol propellants and solvents.

To aggregate the greenhouse gases covered in the accounts, a weighting based on the relative global warming potential (GWP) of each of the gases is applied, using the effect of CO₂ over a 100 year period as a reference. This gives methane a weight of 21 relative to CO₂ and nitrous oxide a weight of 310 relative to CO₂. SF₆ has a GWP of 23,900 relative to CO₂. The GWP of the other fluorinated compounds varies according to the individual gas.

Greenhouse gas emissions are sometimes shown in terms of carbon equivalent rather than CO₂ equivalent. To convert from CO₂ equivalent to carbon equivalent it is necessary to multiply by 12/44.

Acid rain precursors

The term 'acid rain' describes the various chemical reactions which acidic gases and particles undergo in the atmosphere. The gases may be transported long distances before being deposited as wet or dry deposition. When deposited, hydrogen ions may be released, forming dilute acids, which damage ecosystems and buildings. The gases covered are sulphur dioxide (SO₂), nitrogen oxides (NO_x) and ammonia (NH₃).

The emissions are weighted together using their relative acidifying effects. The weights, given relative to SO₂, are 0.7 for NO_x and 1.9 for NH₃. This is a simplification of the chemistry involved, and there are a number of factors which can affect the eventual deposition and effect of acid rain. There may be an upward bias on the weights of the nitrogen-based compounds in terms of damage to ecosystems.

Sulphur dioxide (SO₂) is produced when coal and some petroleum products containing sulphur impurities are burnt. Sulphur dioxide is an acid gas that can cause respiratory irritation. It can damage ecosystems and buildings directly and is a major contributor to acid rain.

Nitrogen oxides (NO_x) arise when fossil fuels are burnt under certain conditions. High concentrations are harmful to health

and reduce plant growth. Like sulphur dioxide, nitrogen oxides contribute to acid rain; nitrogen dioxide (NO₂) also plays a part in the formation of ground ozone layer.

Ammonia (NH₃) is predominantly emitted from spreading animal manure and some fertilisers.

Other air pollutants

PM₁₀s are smoke particles whose diameter is less than ten microns. They are regarded as responsible for some physiological damage and have been linked to premature mortality from respiratory diseases.

Carbon monoxide (CO) is produced in small quantities when fossil fuel is burnt with insufficient oxygen for complete combustion. At high concentrations carbon monoxide is toxic.

Non-methane volatile organic compounds (NMVOCs) cover a variety of chemicals, many of which are known carcinogens. Emissions of NMVOCs arise from the deliberate and incidental evaporation of solvents (for example in paints and cleaning products), from accidental spillage and from non-combustion of petroleum products. The environmental accounts include natural emissions of NMVOCs from managed forests. NMVOCs play a role in the formation of ground level ozone, which can have an adverse effect on health. The NMVOC emissions include benzene and 1,3-butadiene.

Benzene is released largely from the distribution and combustion of petrol. It is a carcinogen which has also been found to cause bone-marrow depression and consequent leukopenia (depressed white blood cell count) on prolonged exposure.

1,3-Butadiene is a colourless, gaseous hydrocarbon. It is produced by dehydrogenation of butene, or of mixtures of butene and butane; it may also be made from ethanol. 1,3-butadiene is believed to be a carcinogen, for which the safe level is not known. Emissions of 1,3-butadiene arise from combustion of petroleum products and in its manufacture of synthetic rubber, nylon and latex paints in the chemical industry. 1,3-butadiene is not present in petrol but is formed as a by-product of combustion. The increasing use of catalytic converters through the 1990s has caused a significant reduction in emissions from the road transport sector.

Heavy Metals

Lead (Pb) is a heavy metal that is emitted from the combustion of petrol, coal combustion and metal works. Emissions of lead continued to fall in 2000, mainly as a result of the ban on the sale of leaded petrol from 1 January 2000. Lead has been found to inhibit the development of children's intelligence. If the levels of lead are sufficient, lead can cause degenerative processes such as osteoporosis, inhibit many enzyme reactions

in the body and cause reproductive disorders such as sterility and miscarriages.

Cadmium (Cd) is a normal constituent of soil and water at low concentrations. Industrially, cadmium is used as an anti-friction agent, in alloys, semi-conductors, control rods for nuclear reactors and PVC and battery manufacture. The main sources of cadmium emissions are from waste incineration, and iron and steel manufacture. Emissions of cadmium have declined over recent years; this is mainly attributable to the decline in coal combustion.

Environmentally, cadmium is dangerous because many plants and some animals absorb it easily and concentrate it in tissues. Cadmium competes with calcium in the body, and if levels are sufficient, it will displace calcium, causing embrittlement of bones and painful deformations of the skeleton. Cadmium also competes with zinc in the body, and if levels of cadmium are high enough, cadmium will also displace zinc from enzymes in the body.

Mercury (Hg) emissions are generated by waste incineration, the manufacture of chlorine in mercury cells, non-ferrous metal production and coal combustion. Emissions of mercury have declined over recent years due to improved controls on mercury cells and their replacement by diaphragm cells and the decline of coal use. Due to the volatility of mercury, if levels are sufficiently high, compounds containing mercury attack and destroy various parts of the body, particularly teeth, lung tissues and intestines.

All data refer to end of year. Components may not sum to totals due to rounding.

Source: ONS and Department of Energy and Climate Change

- 1 The lower end of the range of total reserves has been calculated as the sum of proven reserves and the lower end of the range of undiscovered reserves.
- 2 The upper end of the range of total reserves is the sum of proven, probable and possible reserves and the upper end of the range of undiscovered reserves.
- 3 Expected reserves are the sum of proven reserves, probable reserves and the lower end of the range of undiscovered reserves.
- 4 Negative extraction is shown here for the purposes of the calculation only. Of itself, extraction should be considered as a positive value.

1 PM₁₀ is particulate matter arising from various sources including fuel combustion quarrying and construction, and formation of 'secondary' particles in the atmosphere from reactions involving other pollutants sulphur dioxide, nitrogen oxides, ammonia and NMVOCs

2 Non-methane Volatile Compounds, including benzene and 1,3-butadiene.

The earliest revision is represented by a cross

¹ Components may not sum to totals due to rounding.² Indirect flows from domestic extraction relate to unused material which is moved during extraction, such as overburden from mining and quarrying.³ A positive physical trade balance indicates a net import of material into the UK. This calculation of the PTB differs from the National Accounts formula (exports-imports) because flows of materials and products are considered the inverse of the flows of money recorded in the National Accounts.

Source: ONS, Department for Energy and Climate Change

1 Unleaded petrol includes superunleaded petrol.

2 Lead Replacement Petrol (the alternative to 4-Star leaded petrol introduced in 2000) is lead-free.

3 Duty incentives have concentrated production on ultra low sulphur varieties.

4 Included for the first time following a review of environmental taxes. See background notes for more information.

Supplementary Information

Glossary

Above the line

Transactions in the production, current and capital accounts which are above the Net lending (+)/Net borrowing (financial surplus or deficit) line in the presentation used in the economic accounts. The financial transactions account is below the line in this presentation.

Accruals basis

A method of recording transactions to relate them to the period when the exchange of ownership of the goods, services or financial asset applies. (See also cash basis). For example, value added tax accrues when the expenditure to which it relates takes place, but Customs and Excise receive the cash some time later. The difference between accruals and cash results in the creation of an asset and liability in the financial accounts, shown as amounts receivable or payable (F7).

Actual final consumption

The value of goods consumed by a sector but not necessarily purchased by that sector. See also Final consumption expenditure, Intermediate consumption.

Advance and progress payments

Payments made for goods in advance of completion and delivery of the goods. Also referred to as stage payments.

Asset boundary

Boundary separating assets included in creating core economic accounts (such as plant and factories, also including non-produced assets such as land and water resources) and those excluded (such as natural assets not managed for an economic purpose).

Assets

Entities over which ownership rights are enforced by institutional units, individually or collectively; and from which economic benefits may be derived by their owners by holding them over a period of time.

Assurance

An equivalent term to insurance, commonly used in the life insurance business.

Balancing item

A balancing item is an accounting construct obtained by subtracting the total value of the entries on one side of an account from the total value for the other side. In the sector accounts in the former system of UK economic accounts the term referred to the difference between the Financial Surplus or Deficit for a sector and the sum of the financial transactions for that sector, currently designated the statistical discrepancy.

Balance of payments

A summary of the transactions between residents of a country and residents abroad in a given time period.

Balance of trade

The balance on trade in goods and services. The balance of trade is a summary of the imports and exports of goods and services across an economic boundary in a given period.

Balance sheet

A statement, drawn up at a particular point in time, of the value of assets owned and of the financial claims (liabilities) against the owner of these assets.

Banks (UK)

Strictly, all financial institutions located in the United Kingdom and recognised by the Bank of England as banks for statistical purposes up to late 1981 or as UK banks from then onwards. This category includes the UK offices of institutions authorised under the Banking Act (1987), the Bank of England, the National Girobank and the TSB Group plc. It may include branches of foreign banks where these are recognised as banks by the Bank of England, but not offices abroad of these or of any British-owned banks. An updated list of banks appears in each February's issue of the Bank of England Quarterly Bulletin. Institutions in the Channel Islands and the Isle of Man which have opted to adhere to the monetary control arrangements introduced in August 1981 were formerly included in the sector but are not considered to be residents of the United Kingdom under the ESA. Banks are included in the Monetary financial institutions (S.121/S.122) sector.

Bank of England

This comprises S.121, the central bank sub-sector of the financial corporations sector.

Bank of England – Issue Department

This part of the Bank of England deals with the issue of bank notes on behalf of central government and was formerly classified to central government though it is now part of the central bank sector. Its activities include, inter alia, market purchases of commercial bills from UK banks.

Basic prices

These prices are the preferred method of valuing gross value added and output. They reflect the amount received by the producer for a unit of goods or services minus any taxes payable plus any subsidy receivable on that unit as a consequence of production or sale (that is the cost of production including subsidies). As a result the only taxes included in the basic price are taxes on the production process – such as business rates and any vehicle excise duty paid by businesses – which are not specifically levied on the production of a unit of output. Basic prices exclude any transport charges invoiced separately by the producer.

Below the line

The financial transactions account which shows the financing of Net lending(+)/Net borrowing (–) (formerly financial surplus or deficit).

Bond

A financial instrument that usually pays interest to the holder, issued by governments as well as companies and other institutions, for example local authorities. Most bonds have a fixed date on which the borrower will repay the holder. Bonds are attractive to investors since they can be bought and sold easily in a secondary market. Special forms of bonds include deep discount bonds, equity warrant bonds, Eurobonds, and zero coupon bonds.

British government securities

See Gilts.

Building society

Those institutions as defined in the Building Society Acts (1962 and 1986). They offer housing finance largely to the households sector and fund this largely by taking short-term deposits from the households sector. They are part of the monetary financial institutions sub-sector.

Capital

Capital assets are those which contribute to the productive process so as to produce an economic return. In other contexts the word can be taken to include tangible assets (for example buildings, plant and machinery), intangible assets and financial capital. See also fixed assets, inventories.

Capital formation

Acquisition less disposals of fixed assets, improvement of land, change in inventories and acquisition less disposals of valuables.

Capital Stock

Measure of the cost of replacing the capital assets of a country, held at a particular point in time.

Capital transfers

Transfers which are related to the acquisition or disposal of assets by the recipient or payer. They may be in cash or kind, and may be imputed to reflect the assumption or forgiveness of debt.

Cash basis

The recording of transactions when cash or other assets are actually transferred, rather than on an accruals basis.

Central monetary institutions (CMIs)

Institutions (usually central banks) which control the centralised monetary reserves and the supply of currency in accordance with government policies, and which act as their governments' bankers and agents. In the UK this is equivalent to the Bank of England. In many other countries maintenance of the exchange rate is undertaken in this sector. In the United Kingdom this function is undertaken by central government (part of the Treasury) by use of the Exchange Equalisation Account.

Certificate of deposit

A short term interest-paying instrument issued by deposit-taking institutions in return for money deposited for a fixed period. Interest is earned at a given rate. The instrument can be used as security for a loan if the depositor requires money before the repayment date.

Chained volume measures

Chained volume measures are time series which measure GDP in real terms (that is excluding price effects).

C.i.f. (cost, insurance and freight)

The basis of valuation of imports for customs purposes, it includes the cost of insurance premiums and freight services. These need to be deducted to obtain the free on board (f.o.b.) valuation consistent with the valuation of exports which is used in the economic accounts.

COICOP (Classification of Individual Consumption by Purpose)

An international classification which groups consumption according to its function or purpose. Thus the heading clothing, for example, includes expenditure on garments, clothing materials, laundry and repairs.

Combined use table

Table of the demand for products by each industry group or sector, whether from domestic production or imports, estimated at purchaser's prices. It displays the inputs used by each industry to produce their total output and separates out intermediate purchases of goods and services. This table shows which industries use which products. Columns represent the purchasing industries: rows represent the products purchased.

Commercial paper

This is an unsecured promissory note for a specific amount and maturing on a specific date. The commercial paper market allows companies to issue short term debt direct to financial institutions who then market this paper to investors or use it for their own investment purposes.

Compensation of employees

Total remuneration payable to employees in cash or in kind. Includes the value of social contributions payable by the employer.

Consolidated Fund

An account of central government into which most government revenue (excluding borrowing and certain payments to government departments) is paid, and from which most government expenditure (excluding loans and National Insurance benefits) is paid.

Consumption

See Final consumption, Intermediate consumption.

Consumption of fixed capital

The amount of capital resources used up in the process of production in any period. It is not an identifiable set of transactions but an imputed transaction which can only be measured by a system of conventions.

Corporations

All bodies recognised as independent legal entities which are producers of market output and whose principal activity is the production of goods and services.

Counterpart

In a double-entry system of accounting each transaction gives rise to two corresponding entries. These entries are the counterparts to each other. Thus the counterpart of a payment by one sector is the receipt by another.

Debenture

A long-term bond issued by a UK or foreign company and secured on fixed assets. A debenture entitles the holder to a fixed interest payment or a series of such payments.

Depreciation

See Consumption of fixed capital.

Derivatives (F.34)

Financial instruments whose value is linked to changes in the value of another financial instrument, an indicator or a commodity. In contrast to the holder of a primary financial instrument (for example a government bond or a bank deposit), who has an unqualified right to receive cash (or some other economic benefit) in the future, the holder of a derivative has only a qualified right to receive such a benefit. Examples of derivatives are options and swaps.

DIM (Dividend and Interest Matrix)

The Dividend and Interest Matrix represents property income flows related to holdings of financial transactions. The gross flows are now shown in D.4.

Direct investment

Net investment by UK/overseas companies in their overseas/UK branches, subsidiaries or associated companies. A direct investment in a company means that the investor has a significant influence on the operations of the company. Investment includes not only acquisition of fixed assets, stock building and stock appreciation but also all other financial transactions such as additions to, or payments of, working capital, other loans and trade credit and acquisitions of securities. Estimates of investment exclude depreciation.

Discount market

That part of the market dealing with short-term borrowing. It is called the discount market because the interest on loans is expressed as a percentage reduction (discount) on the amount paid to the borrower. For example, for a loan of £100 face value when the discount rate is 5 per cent the borrower will receive £95 but will repay £100 at the end of the term.

Double deflation

Method for calculating value added by industry chained volume measures; which takes separate account of the differing price and volume movements of input and outputs in an industry's production process.

Dividend

A payment made to company shareholders from current or previously retained profits. See DIM.

ECGD

See Export Credit Guarantee Department.

Economically significant prices

These are prices whose level significantly affects the supply of the good or service concerned. Market output consists mainly of goods and services sold at 'economically significant' prices while non-market output comprises those provided free or at prices that are not economically significant.

Enterprise

An institutional unit producing market output. Enterprises are found mainly in the non-financial and financial corporations sectors but exist in all sectors. Each enterprise consists of one or more kind-of-activity units.

Environmental accounts

A satellite account describing the relationship between the environment and the economy.

Equity

Equity is ownership or potential ownership of a company. An entity's equity in a company will be evidenced by ordinary shares. They differ from other financial instruments in that they confer ownership of something more than a financial claim. Shareholders are owners of the company whereas bond holders are merely outside creditors.

ESA

European System of National and Regional Accounts. An integrated system of economic accounts which is the European version of the System of National Accounts (SNA).

European Investment Bank

This was set up to assist economic development within the European Union. Its members are the member states of the EU.

European Monetary Cooperation Fund

Central banks of member states of the European Monetary System deposit 20 per cent of their gold and foreign exchange reserves on a short-term basis with the European Monetary Cooperation Fund in exchange for ECUs. The Fund is the clearing house for central banks in the EMS.

Exchange Cover Scheme (ECS)

A scheme first introduced in 1969 whereby UK public bodies raise foreign currency from overseas residents, either directly or through UK banks, and surrender it to the Exchange Equalisation Account in exchange for sterling for use to finance expenditure in the United Kingdom. HM Treasury sells the borrower foreign currency to service and repay the loan at the exchange rate that applied when the loan was taken out.

Exchange Equalisation Account (EEA)

An account of central government held by the Bank of England in which transactions in the

official reserves are recorded. It is the means by which the government, through the Bank of England, influences exchange rates.

Export credit

Credit extended overseas by UK institutions primarily in connection with UK exports but also including some credit in respect of third-country trade.

Export Credits Guarantee Department (ECGD)

A government department whose main function is to provide insurance cover for export credit transactions.

Factor cost

In the former system of national accounts this was the basis of valuation which excluded the effects of taxes on expenditure and subsidies.

Final consumption expenditure

The expenditure on goods and services that are used for the direct satisfaction of individual needs or the collective needs of members of the community as distinct from their purchase for use in the productive process. It may be contrasted with Actual final consumption, which is the value of goods consumed but not necessarily purchased by that sector. See also Intermediate consumption.

Finance houses

Financial corporations that specialise in the financing of hire purchase arrangements.

Financial auxiliaries

Auxiliary financial activities are ones closely related to financial intermediation but which are not financial intermediation themselves, such as the repackaging of funds. Financial auxiliaries include such activities as insurance broking and fund management.

Financial corporations

All bodies recognised as independent legal entities whose principal activity is financial intermediation and/or the production of auxiliary financial services. However, the United Kingdom currently treats financial auxiliaries as non-financial corporations.

Financial intermediation

Financial intermediation is the activity by which an institutional unit acquires financial assets and incurs liabilities on its own account by engaging in financial transactions on the market. The assets and liabilities of financial intermediaries have different characteristics so that the funds are transformed or repackaged with respect to; for example, maturity, scale, risk, in the financial intermediation process.

Financial leasing

A form of leasing in which the lessee contracts to assume the rights and responsibilities of ownership of leased goods from the lessor (the legal owner) for the whole (or virtually the whole) of the economic life of the asset. In the economic accounts this is recorded as the sale of the assets to the lessee, financed by an imputed loan (F.42). The leasing payments are split into interest payments and repayments of principal.

Financial surplus or deficit (FSD)

The former term for Net lending(+) / Net borrowing (–), the balance of all current and capital account transactions for an institutional sector or the economy as a whole.

FISIM

Financial Intermediation Services Indirectly Measured. The output of many financial intermediation services is paid for not by charges but by an interest rate differential. FISIM imputes charges for these services and corresponding offsets in property income. FISIM, an innovation of the 1993 SNA, has been fully implemented in the UK economic accounts; with the earnings allocated to the users of the services. FISIM replaces the Financial Services Adjustment which was a temporary feature carried over from the previous system.

Fixed assets

Produced assets that are themselves used repeatedly or continuously in the production process for more than one year. They comprise buildings and other structures, vehicles and other plant and machinery and also plants and livestock which are used repeatedly or continuously in production, for example fruit trees or dairy cattle. They also include intangible assets such as computer software and artistic originals.

Flows

Economic flows reflect the creation, transformation, exchange, transfer or extinction of economic value. They involve changes in the volume, composition or value of an institutional unit's assets and liabilities. They are recorded in the production, distribution and use of income and accumulation accounts.

F.o.b.

Free on board, the valuation of imports and exports of goods used in the economic accounts, including all costs invoiced by the exporter up to the point of loading on to the ship or aircraft but excluding the cost of insurance and freight from the country of consignment.

Futures

Instruments which give the holder the right to purchase a commodity or a financial asset at a future date.

GFCF

See Gross fixed capital formation.

Gilts

Bonds issued or guaranteed by the UK government. Also known as gilt-edged securities or British government securities.

Gold

The SNA and the IMF (in the 5th Edition of its Balance of Payments Manual) recognise three types of gold:

- monetary gold, treated as a financial asset
- gold held as a store of value, to be included in valuables
- gold as an industrial material, to be included in intermediate consumption or inventories

This is a significant change from previous UK practice and presents problems such that the United Kingdom has received from the European Union a temporary derogation from applying this fully.

The present treatment is as follows:

- In the accounts a distinction is drawn between gold held as a financial asset (financial gold) and gold held like any other commodity (commodity gold). Commodity gold in the form of finished manufactures together with net domestic and overseas transactions in gold moving into or out of finished manufactured form (i.e. for jewellery, dentistry, electronic goods, medals and proof – but not bullion – coins) is recorded in exports and imports of goods
- All other transactions in gold (that is those involving semi-manufactures for example rods, wire; or bullion, bullion coins or banking-type assets and liabilities denominated in gold, including official reserve assets) are treated as financial gold transactions and included in the financial account of the Balance of Payments

The United Kingdom has adopted different treatment to avoid distortion of its trade in goods account by the substantial transactions of the London bullion market.

Grants

Voluntary transfer payments. They may be current or capital in nature. Grants from government or the European Union to producers are subsidies.

Gross

Key economic series can be shown as gross (i.e. before deduction of the consumption of fixed capital or net (i.e. after deduction). Gross has this meaning throughout this book unless otherwise stated.

Gross domestic product (GDP)

The total value of output in the economic territory. It is the balancing item on the production account for the whole economy. Domestic product can be measured gross or net. It is presented in the accounts at market (or purchasers') prices.

Gross fixed capital formation (GFCF)

Acquisition less disposals of fixed assets and the improvement of land.

Gross national disposable income

The income available to the residents arising from GDP, and receipts from, less payments to, the rest of the world of employment income, property income and current transfers.

Gross value added (GVA)

The value generated by any unit engaged in production, and the contributions of individual sectors or industries to gross domestic product. It is measured at basic prices, excluding taxes less subsidies on products.

Hidden economy

Certain activities may be productive and also legal but are concealed from the authorities for various reasons – for example to evade taxes or

regulation. In principle these, as well as economic production that is illegal, are to be included in the accounts but they are by their nature difficult to measure.

Holding gains or losses

Profit or loss obtained by virtue of the changing price of assets being held. Holding gains or losses may arise from either physical or financial assets.

Households (S.14)

Individuals or small groups of individuals as consumers and in some cases as entrepreneurs producing goods and market services (where such activities cannot be hived off and treated as those of a quasi corporation).

Imputation

The process of inventing a transaction where, although no money has changed hands, there has been a flow of goods or services. It is confined to a very small number of cases where a reasonably satisfactory basis for the assumed valuation is available.

Index-linked gilts

Gilts whose coupon and redemption value are linked to movements in the retail prices index.

Institutional unit

Institutional units are the individual bodies whose data is amalgamated to form the sectors of the economy. A body is regarded as an institutional unit if it has decision-making autonomy in respect of its principal function and either keeps a complete set of accounts or is in a position to compile, if required, a complete set of accounts which would be meaningful from both an economic and a legal viewpoint.

Institutional sector

See Sector.

Input–Output

A detailed analytical framework based on Supply and Use tables. These are matrices showing the composition of output of individual industries by types of product and how the domestic and imported supply of goods and services is allocated between various intermediate and final uses, including exports.

Intangible assets

Intangible fixed assets include mineral exploration, computer software and entertainment, literary or artistic originals. Expenditure on them is part of gross fixed capital formation. They exclude non-produced intangible assets such as patented entities, leases, transferable contracts and purchased goodwill, expenditure on which would be intermediate consumption.

Intermediate consumption

The consumption of goods and services in the production process. It may be contrasted with final consumption and capital formation.

International Monetary Fund (IMF)

A fund set up as a result of the Bretton Woods Conference in 1944 which began operations in

1947. It currently has about 180 member countries including most of the major countries of the world. The fund was set up to supervise the fixed exchange rate system agreed at Bretton Woods and to make available to its members a pool of foreign exchange resources to assist them when they have balance of payments difficulties. It is funded by member countries' subscriptions according to agreed quotas.

Inventories

Inventories (known as stocks in the former system) consist of finished goods (held by the producer prior to sale, further processing or other use) and products (materials and fuel) acquired from other producers to be used for intermediate consumption or resold without further processing.

Investment trust

An institution that invests its capital in a wide range of other companies' shares. Investment trusts issue shares which are listed on the London Stock Exchange and use this capital to invest in the shares of other companies. See also Unit trusts.

Kind-of-activity unit (KAU)

An enterprise, or part of an enterprise, which engages in only one kind of non-ancillary productive activity, or in which the principal productive activity accounts for most of the value added. Each enterprise consists of one or more kind-of-activity units.

Liability

A claim on an institutional unit by another body which gives rise to a payment or other transaction transferring assets to the other body. Conditional liabilities, that is where the transfer of assets only takes place under certain defined circumstances, are known as contingent liabilities.

Liquidity

The ease with which a financial instrument can be exchanged for goods and services. Cash is very liquid whereas a life assurance policy is less so.

Lloyd's of London

The international insurance and reinsurance market in London.

Marketable securities

Securities which can be sold on the open market.

Market output

Output of goods and services sold at economically significant prices.

Merchant banks

These are monetary financial institutions whose main business is primarily concerned with corporate finance and acquisitions.

Mixed income

The balancing item on the generation of income account for unincorporated businesses owned by households. The owner or members of the same household often provide unpaid labour inputs to the business. The surplus is therefore a

mixture of remuneration for such labour and return to the owner as entrepreneur.

Money market

The market in which short-term loans are made and short-term securities traded. 'Short-term' usually applies to periods under one year but can be longer in some instances.

NACE

The industrial classification used in the European Union. Revision 1.1 is the 'Statistical classification of economic activities in the European Community in accordance with Commission Regulation (EC) No. 29/2002 of 19th December 2001'.

National income

See Gross national disposable income and Real national disposable income.

National Loans Fund

An account of HM Government set up under the National Loans Fund Act (1968) which handles all government borrowing and most domestic lending transactions.

Net

After deduction of the consumption of fixed capital. Also used in the context of financial accounts and balance sheets to denote, for example, assets less liabilities.

Non-market output

Output of own account production of goods and services provided free or at prices that are not economically significant. Non-market output is produced mainly by the general government and NPISH sectors.

NPISH

Non-profit institutions serving households (S.15). These include bodies such as charities, universities, churches, trade unions or member's clubs.

Operating surplus

The balance on the generation of income account. Households also have a mixed income balance. It may be seen as the surplus arising from the production of goods and services before taking into account flows of property income.

Operating leasing

The conventional form of leasing, in which the lessee makes use of the leased asset for a period in return for a rental while the asset remains on the balance sheet of the lessor. The leasing payments are part of the output of the lessor, and the intermediate consumption of the lessee. See also Financial leasing.

Ordinary share

The most common type of share in the ownership of a corporation. Holders of ordinary shares receive dividends. See also Equity.

Output for own final use

Production of output for final consumption or gross fixed capital formation by the producer. Also known as own-account production.

Own-account production

Production of output for final consumption or gross fixed capital formation by the producer. Also known as output for own final use.

Par value

A security's face or nominal value. Securities can be issued at a premium or discount to par.

Pension funds

The institutions that administer pension schemes. Pension schemes are significant investors in securities. Self-administered funds are classified in the financial accounts as pension funds. Those managed by insurance companies are treated as long-term business of insurance companies. They are part of S.125, the Insurance corporations and pension funds sub-sector.

Perpetual Inventory Model (or Method) (PIM)

A method for estimating the level of assets held at a particular point of time by accumulating the acquisitions of such assets over a period and subtracting the disposals of assets over that period. Adjustments are made for price changes over the period. The PIM is used in the UK accounts to estimate the stock of fixed capital, and hence the value of the consumption of fixed capital.

Portfolio

A list of the securities owned by a single investor. In the Balance of Payments statistics, portfolio investment is investment in securities that does not qualify as direct investment.

Preference share

This type of share guarantees its holder a prior claim on dividends. The dividend paid to preference share holders is normally more than that paid to holders of ordinary shares. Preference shares may give the holder a right to a share in the ownership of the company (participating preference shares). However in the UK they usually do not, and are therefore classified as bonds (F.3).

Prices

See economically significant prices, basic prices, producers' prices.

Principal

The lump sum that is lent under a loan or a bond.

Private sector

Private non-financial corporations, financial corporations other than the Bank of England (and Girobank when it was publicly owned), households and the NPISH sector.

Production boundary

Boundary between production included in creating core economic accounts (such as all economic activity by industry and commerce) and production which is excluded (such as production by households which is consumed within the household).

Promissory note

A security which entitles the bearer to receive cash. These may be issued by companies or other institutions. (See commercial paper).

Property income

Incomes that accrue from lending or renting financial or tangible non-produced assets, including land, to other units. See also Tangible assets.

Public corporations

These are public trading bodies which have a substantial degree of financial independence from the public authority which created them. A public corporation is publicly controlled to the extent that the public authority, that is central or local government, usually appoints the whole or a majority of the board of management. Such bodies comprise much the greater part of sub-sector S.11001, public non-financial corporations.

Public sector

Comprises general government plus public non-financial corporations.

Purchasers' prices

These are the prices paid by purchasers. They include transport costs, trade margins and taxes (unless the taxes are deductible by the purchasers from their own tax liabilities).

Quasi-corporations

Unincorporated enterprises that function as if they were corporations. For the purposes of allocation to sectors and sub-sectors they are treated as if they were corporations, that is separate units from those to which they legally belong. Three main types of quasi-corporation are recognised in the accounts: unincorporated enterprises owned by government which are engaged in market production, unincorporated enterprises (including partnerships) owned by households and unincorporated enterprises owned by foreign residents. The last group consists of permanent branches or offices of foreign enterprises and production units of foreign enterprises which engage in significant amounts of production in the territory over long or indefinite periods of time.

Real national disposable income (RNDI)

Gross national disposable income adjusted for changes in prices and in the terms of trade.

Related companies

Branches, subsidiaries, associates or parents.

Related import or export credit

Trade credit between related companies, included in direct investment.

Rental

The amount payable by the user of a fixed asset to its owner for the right to use that asset in production for a specified period of time. It is included in the output of the owner and the intermediate consumption of the user.

Rents (D.45)

The property income derived from land and sub-soil assets. It should be distinguished in the current system from rental income derived from buildings and other fixed assets, which is included in output (P.1).

Repurchase agreement (Repo)

A deal in which an institution lends or 'sells' another institution a security and agrees to buy it back at a future date. Legal ownership does not change under a 'repo' agreement. It was previously treated as a change of ownership in the UK financial account but under the SNA is treated as a collateralised deposit (F.22).

Reserve assets

The UK official holdings of gold, convertible currencies, Special Drawing Rights, changes in the UK reserve position with the IMF and European currency. They include units acquired from swaps with the European Monetary Co-operation Fund (EMCF).

Residents

These comprise general government, individuals, private non-profit-making bodies serving households and enterprises within the territory of a given economy.

Residual error

The term used in the former accounts for the difference between the measures of gross domestic product from the expenditure and income approaches.

Resources and Uses

The term resources refers to the side of the current accounts where transactions which add to the amount of economic value of a unit or sector appear. For example, wages and salaries are a resource for the unit or sector receiving them. Resources are by convention put on the right side, or at the top of tables arranged vertically. The left side (or bottom section) of the accounts, which relates to transactions that reduce the amount of economic value of a unit or sector, is termed uses. To continue the example, wages and salaries are a use for the unit or sector that must pay them.

Rest of the world

This sector records the counterpart of transactions of the whole economy with non-residents.

Satellite accounts

Satellite accounts describe areas or activities not dealt with by core economic accounts. These areas/activities are considered to require too much detail for inclusion in the core accounts or they operate with a different conceptual framework. Internal satellite accounts re-present information within the production boundary. External satellite accounts present new information not covered by the core accounts.

Saving

The balance on the use of income account. It is that part of disposable income which is not spent on final consumption, and may be positive or negative.

Sector

In the economic accounts the economy is split into different institutional sectors, that is groupings of units according broadly to their role in the economy. The main sectors are non-financial corporations, financial corporations, general government, households

and non-profit institutions serving households (NPISH). The Rest of the world is also treated as a sector for many purposes within the accounts.

Secondary market

A market in which holders of financial instruments can re-sell all or part of their holding. The larger and more effective the secondary market for any particular financial instrument the more liquid that instrument is to the holder.

Securities

Tradeable or potentially tradeable financial instruments.

SIC

Standard Industrial Classification. The industrial classification applied to the collection and publication of a wide range of economic statistics. The current version, SIC03, is consistent with NACE, Rev.1.1.

SNA

System of National Accounts, the internationally agreed standard system for macroeconomic accounts. The latest version is described in System of National Accounts 1993.

Special Drawing Rights (SDRs)

These are reserve assets created and distributed by decision of the members of the IMF. Participants accept an obligation, when designated by the IMF to do so, to provide convertible currency to another participant in exchange for SDRs equivalent to three times their own allocation. Only countries with a sufficiently strong balance of payments are so designated. SDRs may also be used in certain direct payments between participants in the scheme and for payments of various kinds to the IMF.

Stage payments

See Advance and progress payments.

Stocks, stockbuilding

The terms used in the former system corresponding to inventories and changes in inventories.

Subsidiaries

Companies owned or controlled by another company. Under Section 736 of the Companies Act (1985) this means, broadly speaking, that another company either holds more than half the equity share capital or controls the composition of the board of directors. The category also includes subsidiaries of subsidiaries.

Subsidies (D.3)

Current unrequited payments made by general government or the European Union to enterprises. Those made on the basis of a quantity or value of goods or services are classified as 'subsidies on products' (D.31). Other subsidies based on levels of productive activity (for example numbers employed) are designated Other subsidies on production (D.39).

Suppliers' credit

Export credit extended overseas directly by UK firms other than to related concerns.

Supply table

Table of estimates of domestic industries' output by type of product. Compiled at basic prices and includes columns for imports of goods and services, for distributors' trading margins and for taxes less subsidies on products. The final column shows the value of the supply of goods and services at purchaser's prices. This table shows which industries make which products. Columns represent the supplying industries: rows represent the products supplied.

Tangible assets

These comprise produced fixed assets and non-produced assets. Tangible fixed assets, the acquisition and disposal of which are recorded in gross fixed capital formation (P.51), comprise buildings and other structures (including historic monuments), vehicles, other machinery and equipment and cultivated assets in the form of livestock and trees yielding repeat products (for example dairy cattle, orchards). Tangible non-produced assets are assets such as land and sub-soil resources that occur in nature over which ownership rights have been established. Similar assets to which ownership rights have not been established are excluded as they do not qualify as economic assets. The acquisition and disposal of non-produced assets in principle is recorded separately in the capital account (K.2). The distinction between produced and non-produced assets is not yet fully possible for the United Kingdom.

Taxes

Compulsory unrequited transfers to central or local government or the European Union. Taxation is classified in the following main groups: taxes on production and imports (D.2), current taxes on income wealth, etc (D.5) and capital taxes (D.91).

Technical reserves (of insurance companies)

These reserves consist of pre-paid premiums, reserves against outstanding claims, actuarial reserves for life insurance and reserves for with-profit insurance. They are treated in the economic accounts as the property of policy-holders.

Terms of trade

Ratio of the change in export prices to the change in import prices. An increase in the terms of trade implies that the receipts from the same quantity of exports will finance an increased volume of imports. Thus measurement of real national disposable income needs to take account of this factor.

Transfers

Unrequited payments made by one unit to another. They may be current transfers (D.5–7) or capital transfers (D.9). The most important types of transfers are taxes, social contributions and benefits.

Treasury bills

Short-term securities or promissory notes which are issued by government in return for funding from the money market. In the United Kingdom every week the Bank of England invites tenders for sterling Treasury bills from the financial

institutions operating in the market. ECU-denominated bills are issued by tender each month. Treasury bills are an important form of short-term borrowing for the government, generally being issued for periods of 3 or 6 months.

Unit trusts

Institutions within sub-sector S.123 through which investors pool their funds to invest in a diversified portfolio of securities. Individual investors purchase units in the fund representing an ownership interest in the large pool of underlying assets, that is they have an equity stake. The selection of assets is made by professional fund managers. Unit trusts therefore give individual investors the opportunity to invest in a diversified and professionally managed portfolio of securities without the need for detailed knowledge of the individual companies issuing the stocks and bonds. They differ from investment trusts in that the latter are companies in which investors trade shares on the Stock Exchange, whereas unit trust units are issued and bought back on demand by the managers of the trust. The prices of unit trust units thus reflect the value of the underlying pool of securities, whereas the price of shares in investment trusts are affected by the usual market forces.

Uses

See Resources and Uses

Use Table

See Combined Use Table.

United Kingdom

Broadly, in the accounts, the United Kingdom comprises Great Britain plus Northern Ireland and that part of the continental shelf deemed by international convention to belong to the UK. It excludes the Channel Islands and the Isle of Man.

Valuables

Goods of considerable value that are not used primarily for production or consumption but are held as stores of value over time. They consist of, for example, precious metals, precious stones, jewellery, works of art. As a new category in the accounts the estimates for them are currently fairly rudimentary, though transactions are likely to have been recorded elsewhere in the accounts.

Valuation

See Basic prices, Purchasers' prices, Factor cost.

Value added

The balance on the production account: output less intermediate consumption. Value added may be measured net or gross.

Value Added Tax (VAT) (D.211)

A tax paid by enterprises. In broad terms an enterprise is liable for VAT on the total of its taxable sales but may deduct tax already paid by suppliers on its inputs (intermediate consumption). Thus the tax is effectively on the value added by the enterprise. Where the enterprise cannot deduct tax on its inputs the tax is referred to as non-deductible. VAT is the main UK tax on products (D.21).

Index

Figures indicate Table numbers. The letter “**G**” indicates that the item appears in the Glossary. Where the item is discussed in the section introductions, the appropriate page number is given.

Key for this index

References are either to pages of text or to table numbers.

S – appears in sector tables which are numbered using the following system:

The table numbering system for the Blue Book shows the relationships between the UK, its sectors and the rest of the world. A 3-part numbering system (e.g. 1.7.2) has been adopted for the accounts drawn directly from the ESA95. The first two digits denotes the UK sector, the third digit denotes the ESA95 account. They are as follows:

- 0** Goods and services account
- 1** Production account
- 2** Generation of income account
- 3** Allocation of primary income account
- 4** Secondary distribution of income account
- 5** Redistribution of income in kind account
- 6** Use of income account
- 7** Accumulation account
- 8** Financial account
- 9** Financial balance sheet
