# Labour Market Update 

## Data released on or before 15 August 2001

All figures are seasonally adjusted and for UK unless otherwise stated. For detailed figures, definitions and concepts see the Labour Market Data section.

## Headlines

- Rising employment indicated by April-June 2001 Labour Force Survey (LFS) results.
(1) ILO unemployment rate down in April-June 2001 LFS. Fall in July 2001 claimant count.

Growth in the employment rate shows signs of levelling off with the working age rate unchanged. The ILO unemployment rate is still falling and there was a reduction in the number of people claiming unemployment-related benefits. The whole economy headline average earnings growth rate has risen.
Labour Force Survey data for April to June 2001 show that the working age employment rate was 74.8 per cent, unchanged over the preceding three months. Survey estimates indicate that employment rose by 75,000 over the quarter and by 250,000 over the year.

The ILO unemployment rate was 5.0 per cent, down 0.1 percentage point from the preceding three months and down 0.5 percentage points from a year earlier. The claimant count fell by 12,800 in July 2001. The average monthly fall in the claimant count has been 9,900 over the past three months and 9,300 over the past six months.

The headline rate of growth of average earnings in June 2001 was 4.8 per cent, up 0.2 percentage points from May 2001 .

## New this month

April-June 2001: Latest LFS three-month average results, earnings;
July 2001 data: Claimant count, vacancies and placings;
June 2001 data: Manufacturing productivity and unit wage costs, manufacturing jobs, labour disputes.

## Figure 1

## Working-age employment rate <br> Sampling variability $\pm 0.4 \%$

## SUMMARY

- Employment rate was 74.8 per cent among people of working age in the April-June 2001 period, unchanged from January-March 2001 but up 0.2 percentage points on the same period a year earlier (Figure I, Table A.I).
(1) ILO unemployment rate was 5.0 per cent in the April-June 2001 period, down 0.1 percentage point from January-March 2001 and down 0.5 percentage points on the same period a year earlier (Figure 2, Table A.I).
- Employment was 28.18 million in April-June 2001, up 250,000 on the same period year earlier (Table A.I).
( Workforce jobs rose by 119,000 over the year to 29.15 million in March 2001; this comprised a rise of 5,000 male jobs and a rise of 114,000 female jobs (Table A.3).
(1LO unemployment level was I. 48 million in April-June 2001. This is $\mathbf{1 3 4 , 0 0 0}$ lower than the same period a year earlier (Table A.I).
(1) Claimant count down 12,800 on the month to July 2001 to 950,300 . Claimant count rate in July 2001 was 3.2 per cent, unchanged from June 2001 (Table A.3).
- Economic activity rate was 78.8 per cent among people of working age in April-June 2001, unchanged from January-March 2001 but down 0.2 percentage points from April-June 2000 (Table A.I).
(1) Economic inactivity rate was 21.2 per cent among people of working age in the April-June 2001 period, unchanged from January-March 2001 but up 0.2 percentage points from April-June 2000 (Table A.I).
- GB headline rate for average earnings was 4.8 per cent in June 2001, up 0.6 percentage points on the same period a year earlier. This is up 0.2 percentage points from the May 2001 rate (Figure 3, Table A.3).
(1) New vacancies notified to Jobcentres up 10,200 in July 2001 to 250,900 (Table A.3).
(1) Stock of unfilled vacancies up 17,100 in July 2001 to 444,300 (Table G.I).

## EMPLOYMENT

(1) Men in employment down 4,000 since January-March 2001 to 15.50 million in April-June 200I, and women up 79,000 in the same period to 12.67 million (Figures 4 and 5, Table B.I).
(1) People in full-time employment up 93,000 since January-March 2001 to 21.16 million in April-June 2001. People in part-time employment down 18,000 over the same period to 7.02 million (Table B.I).
(1) Manufacturing employee jobs down by 110,000 in the three months to June 2001 compared with the same three months a year ago, at 3.85 million (Table B. I2).

- The LFS estimate of the total number of actual hours worked per week was 924.6 million during April-June 200I, up I.I per cent from April-June 2000. This is due to an increase in total employment of 0.9 per cent over the year combined with an increase of 0.3 per cent in average actual weekly hours (Table B. 2 I ).

## UNEMPLOYMENT

(1) Number of people ILO unemployed for between six and $\mathbf{I 2}$ months down 23,000 over the year to stand at 219,000 in April-June 2001 (Table C.I).

- ILO unemployment over $\mathbf{I 2}$ months fell 66,000 over the year to stand at 382,000 in April-June 2001 (Figure 6, Table C.I).
(1) ILO unemployment for those aged 18 to $\mathbf{2 4}$ years fell I4,000 over the year to stand at 371,000 in April-June 2001 (Table C.I).
(1) ILO unemployment rate for UK government office regions down in all regions over the year except for Wales and the North West region, which were unchanged, and East Midlands, which went up. The highest rate is in the North East at 7.4 per cent and lowest is in the South East region at 3.2 per cent (Figure 7, Table A.II).
- Claimant count over $\mathbf{1 2}$ months (computerised claims only, unadjusted) shows a fall of 50,300 over the year to stand at 190,900 in July 2001 (Table C.I2).
© Total claimants aged 18-24 (computerised claims only, unadjusted) stood at 240,700 in July 2001, a fall of 26,700 since July 2000 (Table C.I2).
© Claimant count aged 18 to $\mathbf{2 4}$ over $\mathbf{1 2}$ months (computerised claims only, unadjusted) stood at 4,500 in July 2001, a fall of I,900 since July 2000 (Table C.I2).
- Number of people in categories affected by New Deal (computerised claims only, unadjusted):

|  | July 2001 | Change on year |
| :--- | ---: | ---: |
| I8-24 over six months | 38,193 | $-9,994$ |
| 25 and over more than two years | 91,005 | $-28,521$ |
| Total | $\mathbf{I 2 9 , 1 9 8}$ | $\mathbf{- 3 8 , 5 1 5}$ |

## ECONOMIC ACTIVITY AND INACTIVITY

(1) Number of economically active people was 29.66 million in April-June 2001. Of this total, 16.4 I million were men and I 3.25 million were women (Table D.I).

- Number of economically inactive people of working age was 7.75 million in April-June 2001. Of this total 5.56 million people did not want a job and 1.98 million wanted a job, but had not actively looked for one (Figure 8, Table D.2).
- The LFS shows that the net increase of the number in employment was 250,000 in the year to April-June 2001. This was balanced by a decrease in the ILO unemployed of 134,000 , an increase in the number of economically inactive of 144,000 , and an increase in the total population aged 16 and over of 260,000 (Table A.I).
- Economic activity rate for men of working age was 84.2 per cent in AprilJune 2001, down 0.3 percentage points from January-March 2001, while the rate for women was 72.9 per cent for the same period, up 0.3 percentage points from the January-March 2001 period (Table D.I).

Economic inactivity rate for men of working age was 15.8 per cent in April-June 2001, up 0.3 percentage points from January-March 2001, while the rate for women was 27.1 per cent for the same period, down 0.3 percentage points from the January-March 2001 period (Table D.3).

Figure II ILO unemployment rates International comparisons, June 2001 (source: UK LFS and Eurostat)

REDUNDANCIES (not seasonally adjusted)

- There were 169,000 people made redundant in spring 2001 (March to May). This compares with 180,000 in spring 2000 (Table C.4I, August 2001).
- Results for spring 2001 show that 9 per thousand of male employees and 5 per thousand of female employees had been made redundant in the three months prior to the interview. Of those made redundant, 50 per cent were back in employment at the time of the interview (Table C.4I, August 2001).

## GB AVERAGE EARNINGS

- Headline (three-month average) rate of increase in average earnings for the whole economy in the year to June 2001 was provisionally estimated to be 4.8 per cent, up 0.2 percentage points from the revised May 2001 rate (Figure 9, Table E.I).
- The actual increase in whole economy average earnings in the year to June 2001 was 4.8 per cent, up 0.5 percentage points from the revised May 2001 rate (Table E.I).
(1) In the manufacturing industries, the headline (three-month average) increase for June 2001 was 5.0 per cent, down 0.1 percentage point from the revised May 2001 rate (Figure 9, Table E.I).
(1) The private sector services headline (three-month average) increase was 4.3 per cent for June 2001, up 0.2 percentage points from the revised May 2001 rate (Table E.I).
(1) In the service industries the headline (three-month average) increase was 4.6 per cent in June 2001, up 0.2 percentage points from the revised May 2001 rate (Figure 9, Table E.I).
- Public sector headline (three-month average) increase for June 2001 was 5.5 per cent compared with a year earlier, up 0.2 percentage points from the revised May 2001 rate (Table E.I).
- Private sector headline (three-month average) increase for June 2001 was 4.6 per cent compared with a year earlier, up 0.2 percentage points from the revised May 2001 rate (Table E.I).

PRODUCTIVITY AND UNIT WAGE COSTS

- Manufacturing output was $I .4$ per cent lower in the three months ending June 2001, compared with a year earlier (Table B.32).
- Manufacturing productivity in terms of output per filled job was 3.0 per cent higher in the three months ending June 2001, compared with a year earlier (Table B.32).
- Manufacturing unit wage costs were 1.9 per cent higher in the three months ending June 2001, compared with a year earlier (Table E.21).
(1) Whole economy output per filled job was 2.2 per cent higher in the first quarter of 2001, compared with a year earlier (Figure 10, Table B.32).
(1) Whole economy unit wage costs were 2.1 per cent higher in the first quarter of 2001, compared with a year earlier (Figure 10, Table E.21).

## INTERNATIONAL COMPARISONS

- UK ILO unemployment rate in April-June 2001 was 5.0 per cent, below the EU average of 7.6 per cent in June 2001 and lower than all EU countries except Austria, Denmark, Luxembourg, Ireland, the Netherlands, Portugal and Sweden (Figure II, Table C.5I).
- UK ILO unemployment rate among under-25s at II. 5 per cent in April-June 2001 was lower than all EU countries except Austria, Denmark, Germany, Ireland, Luxembourg, the Netherlands, Portugal and Sweden.
- In EU countries there was an average increase in consumer prices of 2.8 per cent (provisional) over the 12 months to June 2001, compared with 1.7 per cent in the UK. Over the same period consumer prices rose in France by 2.2 per cent (provisional) and in Germany by 3.1 per cent.

## VACANCIES

( New vacancies notified to Jobcentres in July 2001 were 30,300 higher than the same month last year (Figure 12, Table G.I).
(1) Stocks of unfilled vacancies at Jobcentres in July 2001 were 81,400 higher than the same month last year (Table G.I).
(1) Placings by Jobcentres up by 2,400 in July 2001 to stand at 104,000 (Table G.I).

## LABOUR DISPUTES (not seasonally adjusted)

## GOVERNMENT EMPLOYMENT AND TRAINING MEASURES (not seasonally adjusted)

- The number of young people in Work-based training for young people in England and Wales as at 25 March 2001 was 292,700 , I per cent lower than 12 months earlier (Table F.I, August 2001).
- The number participating in Work-based learning for adults in England and Wales as at 25 March 2001 was 34,500 , a 2 per cent reduction over the previous 12 months. Numbers on Basic Employability increased 4 per cent, while Occupational numbers fell by 8 per cent (Table F.I, August 2001).
(1) The total number of starts in Work-based training for young people in England and Wales has increased for the second successive year, with 42 per cent beginning Foundation Modern Apprenticeships, 21 per cent Other Training and 33 per cent Advanced Modern Apprenticeships. There is a small increase in Work-based learning for adults starts in England and Wales to total 113,400 in 2000-01, 42 per cent of which were identified as having Basic Employability needs (Table F.2, August 2001).
- The last I2 months (October 1999 to September 2000) in England saw a small increase in the proportion of leavers and completers entering employment compared to the previous year. There were similar increases for those gaining full or part qualifications (Tables F. 3 and F4,August 2001).
(1) Advanced Modern Apprenticeships trainees in England achieving qualifications has continued. The latest quarter (July to September 2000) shows 55 per cent of trainees
in England achieving at least level 3 qualification, the highest rate to date. The figure for Foundation Modern Apprenticeships for those achieving at least a level 2 qualification is 46 per cent, again the best to date. The rate of achievement for any qualification on Work-based training for young people is 56 per cent (Table F.5, August 2001 ).
(1) The level of trainees entering into employment in England in the year to September 2000 is 71 per cent. 85 per cent of trainees on Advanced Modern Apprenticeships entered employment over the same period, the highest proportion of the main strands of Work-based training for young people (Table F.6, August 2001).
- Some 653,100 18 to 24-year-olds had started on New Deal in Great Britain by the end of May 2001 - 557,200 had left, leaving 95,900 participants at the end of May 2001 (Table F.II).
- Some 39 per cent of these leavers entered sustained unsubsidised jobs, II per cent transferred to other benefits, 20 per cent left for other known reasons and 30 per cent for unknown reasons (Table F.14).
(1) By the end of May 2001, 356,700 people aged 25 or more had started on New Deal for the Long-Term Unemployed in Great Britain - 313,600 had left, leaving 43,100 participating at the end of May 2001 (Table F.I6).
- In all, 59,610 people had entered sustained jobs in Great Britain by the end of May 200I, of which 46,610 were unsubsidised and 13,010 were subsidised (Table F.19).

## ECONOMIC BACKGROUND

(1) Gross domestic product (GDP) at constant market prices in the second quarter of 2001 grew by 0.3 per cent, down from 0.5 per cent in the previous quarter. Compared with the second quarter of 2000, GDP has grown by 2.1 per cent.
(1) Retail sales volumes in the three months to June 2001 were 1.6 per cent higher than in the previous three months and 6.1 per cent higher than in the same period a year earlier.
(1) Manufacturing output in the three months to June 2001 was 2.0 per cent lower compared with the previous three months and I. 3 per cent lower than the same period a year earlier.
(1) The total volume of construction output in the first quarter of 2001 was 1.8 per cent higher compared with the previous quarter and 1.5 per cent higher than the same quarter a year earlier.
(1) Business investment was 5.0 per cent lower in the first quarter of 2001 than the previous quarter but 2.3 per cent higher than the first quarter of 2000.
(1) Government consumption in the first quarter of 2001 was up 0.8 per cent on the previous quarter and 2.7 per cent higher than a year earlier.
(1) The balance of trade in goods in the three months to May 2001 was in deficit by $£ 8.0$ billion, up from a deficit of $£ 7.6$ billion in the previous three months and up from a deficit of $£ 6.9$ billion a year earlier.

- Excluding oil and erratics, export volumes in the three months to May 2001 were 3.I per cent lower than the previous three months but 4.9 per cent higher than the same period a year earlier.
- Excluding oil and erratics, import volumes in the three months to May 2001 were 2.1 per cent lower than the previous three months but up 5.8 per cent on the same three months last year.
(1) The all items retail prices index (RPI) stood at I73.3 for July 200I, down from I74.4 in June.
- In the 12 months to July, the all items RPI rose by 1.6 per cent, down from 1.9 per cent in June.
- Over the same period, the all items excluding mortgage interest payments index (RPIX) rose by 2.2 per cent, down from 2.4 per cent last month.
- The largest downward effect on the all items 12 -month rate came from changes in food prices and, in particular, seasonal foods. Another large downward effect came from changes in motoring costs. In addition, there were downward effects from vehicle tax and insurance. A partially offsetting upward effect within motoring expenditure came from prices for second-hand cars. Further small downward effects came from household goods and personal goods and services. A large upward effect came from price changes for clothing and footwear. Another large upward effect came from price changes for leisure services and additional upward effects were evident from changes in housing costs.

If you have any comments or suggestion on the Labour Market Update please e-mail labour.market@ons.gov.uk.

## Next month

The next Labour Market Update, as well as containing the usual monthly labour market statistics, will also include the latest workforce jobs data.

## Labour market statistics on the Web

ONS IS embarked on a major programme to update the accessibility of its statistical outputs. Two recent developments will be of considerable interest to users of labour market statistics. Starting with the August 2001 issue, Labour Market Trends is available on the National Statistics website and will appear on publication day each month from now on. Another major benefit to users comes from the provision of a free on-line service for local area labour market statistics via the Nomis© database run on behalf of National Statistics by Durham University.
Labour Market Trends can be seen at
http://www.statistics.gov.uk/products/p550 .asp. Efforts are underway to expand the coverage to include as much as possible of the contents of earlier editions, although it will not be possible to present complete back issues. Initial efforts will concentrate on placing recent major feature articles, technical reports and regional Spotlight articles, as well as the Labour Market Trends Index, on the website.

Nomis ${ }^{\ominus}$ is the most comprehensive source of official labour market statistics available on-line. Data are available from sources including the Labour Force Survey, the Annual Business Inquiry and the New Earnings Survey for a wide range of geographical areas on employment,
unemployment, earnings and vacancies, as well as more general population characteristics. A recent major addition to the Nomis ${ }^{\ominus}$ data holdings is the New Earnings Survey 2000. The 1999 survey results are due to be added soon. Nomis ${ }^{\odot}$ also provides comprehensive analytical facilities enabling users to explore and manipulate time series data and carry out cross-sectional analyses. Although Nomis ${ }^{\odot}$ was established in 1986 this is the first time that this valuable service has been available free of all charges. To find out more, or register on-line to use the service, visit the website www.nomisweb.co.uk or e-mail info@nomisweb.co.uk.

## Injury at work

THE HEALTH and Safety Executive (HSE) has published provisional figures showing an increase of 34 per cent in fatalities caused by injuries at work in Great Britain in the year from 1 April 2000 to 31 March 2001 compared with the year before. The rate of fatal injuries at work increased from 0.8 to 1.1 per 100,000 workers. Over the same period the provisional number of non-fatal major injuries fell by 4.7 per cent from 29,315 to 27,935.
The latest figures for 2000-2001, based on the number of injuries and fatalities reported so far plus an estimate for late reports, show that:

- the number of fatal injuries to workers is estimated to have increased from 220 in the previous year to 295 last year;
- there were 215 fatal injuries to employees, 53 more than in 1999-2000; and 80 fatal injuries to the self-employed, 22 more than in the year before;
- the fatal injury rate for employees rose to 0.9 per 100,000 from 0.7 the year before; and
- the fatal injury rate for the self-employed increased to 2.4 per 100,000 from 1.7 in
the previous year (although the rate is known to fluctuate from year to year).

Falls from a height, being struck by a moving vehicle, and being struck by a moving or falling object continued to be the three most common causes of fatal injury, accounting for 25 per cent, 22 per cent and 18 per cent of fatal injuries to workers respectively. The fatal injury rate for workers in the construction industry is estimated at 6.0 per 100,000 workers, which was the highest rate for over ten years and was 28 per cent higher than in 1999-2000. In all, 106 fatalities were estimated to have occurred in the construction industry. In agriculture and construction, the rate of fatal injuries to the self-employed reached its highest level since 1991-92.
The non-fatal major injury rate for employees fell by 5.4 per cent to 110.3 per 100,000 employees. Construction had the highest rate of major injuries to employees at 383.1 per 100,000 , followed by extraction and utility supply at 248.5 and agriculture at 209.5.
The number of fatal injuries to members of the public was estimated to have
increased slightly to 447 from 436 in the previous year. Around 96 per cent of these occurred in the services sector, with 331 fatalities reported from the railway industry. Of these, 298 fatal injuries resulted from acts of suicide or trespass on railways or other relevant transport systems, compared with 274 in 1999-2000.

The report also presents figures for injuries resulting in more than three days absence from work. In 2000-2001, the rate for workers fell by 1.7 per cent from 136,113 to 133,813 . The rate for employees fell by 2.4 per cent compared with the previous year to 537.8 per 100,000 . The total number of these injuries was 133,112 .

The final figures will be published in Health and Safety Statistics 2000/01 and in the Health and Safety Commission's Annual Report 2000/01 available from October 2001.

[^1]
## A selection of recent Parliamentary Questions concerning labour market statistics answered in letters from Len Cook, National Statistician. The date on which the answer was given is at the end of each PQ.

## Employment rates

DAVID LAWS (Yeovil) asked the Chancellor of the Exchequer what proportion of people of working age (a) with disabilities, (b) aged over 50 years, (c) of ethnic minority background and (d) who are single parents, have been in employment for each of the last 10 years in (i) the UK, (ii) England, (iii) Somerset and (iv) Yeovil constituency; and if he will make a statement.

JOHN PULLINGER: I am replying in the National Statistician's absence. Estimates of the number of people in employment in the various groups that you requested are available from the Labour Force Survey (LFS). It has not been possible to supply estimates for the Yeovil constituency in any of the tables as the sample size for this area would be too small to provide a reliable estimate. Table 1 shows the proportions of disabled people of working age in employment, from spring 1998 to spring 2000; estimates are not available before then. Table 2 shows the proportion of people between 51 and working age in employment from spring 1991 to spring 2000; however, the regional breakdown is only available for the latest quarter. The proportion of the ethnic minority population of working age in employment is shown in Table 3. The sample size is too small to provide reliable estimates for the regional breakdown. Table 4 shows the proportion of lone parents of working age in employment. This table shows data for spring 1990, and then spring 1992 to spring 2000, as data for 1991 are not available on a consistent basis. Estimates for Somerset are not available from 1991 to 1999 and the sample size is too small to provide a reliable estimate for spring 2000.

DAVID LAWS also asked the Chancellor of the Exchequer what proportion of the (a) male and (b) male and female working-age population have been in (i) full-time employment and (ii) part-time or full-time employment in each year since 1975.

JOHN PULLINGER: I am replying in the National Statistician's absence. Estimates of the proportion of the working-age population in employment are available from the Labour Force Survey (LFS). Table 1 shows LFS estimates of the proportion of the working-age population in employment and full-time employment from spring 1984 to spring 2000 (not seasonally adjusted). Estimates for 1979 to 1983 are not available on a consistent basis and no LFS data are available before then.

Labour Market Statistics Quarterly Update is designed to inform users about developments taking place as part of ONS' continuing work to improve labour market statistics. It appears every quarter in March, June, September and December.

## Improvements introduced <br> June-August 2001

From the July 2001 issue onwards, Labour Market Trends is available on the National Statistics website at http://www.statistics.gov.uk/products/p550.asp.

Data from the 2000 New Earnings Survey were released on the NomisWeb system in July. This brings free access to detailed data on pay and working time at the regional level to all users of labour market statistics. The New Earnings Survey data for 2000 will be supplemented in the near future to allow analyses of survey results for other years. Contact: Derek Bird, tel. 01633819005 or e-mail derek.bird@ons.gov.uk.

## Work in progress

ONS is continuing with its research to estimate the standard error of the annual growth in the Average Earnings Index (AEI). ONS is currently assessing the quality of the preliminary estimates together with the expert group that advises on the AEI. Once the quality assurance of the estimates has been completed the estimates will be published. Contact: Derek Bird, tel. 01633819005 or e-mail derek.bird@ons.gov.uk.

Work has started to see if there is scope to refine the detailed elements of the quarterly employee jobs series, some of which contain discontinuities between September 1998 and December 1998 as a result of the way the ABI figures were built into the quarterly series. Contact: James Partington, tel. 01928792545 or e-mail james.partington@ ons.gov.uk.

The booklets How exactly is unemployment measured? and How exactly is employment measured? are shortly to be revised and are due for publication later in the year. Contact: Allan Flowers, tel. 02075336106 or e-mail allan.flowers@ons.gov.uk.

The Department for Work and Pensions (DWP) and ONS are undertaking a partnership project to enhance the Labour Force Survey (LFS) in England, known as the Local Labour Force Survey (LLFS). The aim is to achieve a consistent range of labour market indicators across local education authorities in England by improving the quality of estimates in certain areas. The first results of this project will be published in autumn 2001. See pp195-199, Labour Market Trends, May 2000 for more information on the LLFS. To accompany the release of the LLFS, a second edition of The guide to regional and local labour market statistics will be published, as well as a new edition of The Guide to the Labour Force Survey, vol.6. Contact: Ann Blake, ONS, tel. 02075336130 or e-mail ann.blake@ons.gov.uk, or Iain Bell, DWP, tel. 02072735663 or e-mail iain.bell@dfes.gsi.gov.uk.

ONS is continuing to develop historical employment and unemployment series on a consistent ILO basis. ONS is currently in the process of having the methodology quality assured and expects to be able to publish the first set of estimates at the end of 2001. Contact: Craig Lindsay, tel. 02075335896 or e-mail craig.lindsay@ons.gov.uk.

## Future developments

ONS is planning to produce a historical supplement covering the series contained in the labour market statistics First Release. It will include all available long-run time series with notes on consistency over time. This is planned to be available on the National Statistics website later in the year. Contact: Frances Sly, tel. 02075336141 or e-mail frances.sly@ons.gov.uk.

In the future, ONS expects to make LFS data available for a wider range of geographical areas, and improve the quality of unemployment rates for small areas based on internationally agreed definitions. Contact: Ann Blake, tel. 02075336130 or e-mailann.blake@ons.gov.uk.

ONS is developing a new monthly inquiry into the number of vacancies held by employers. The inquiry was launched in November 2000 and is being jointly developed by Employment, Earnings, and Productivity Division and Labour Market Division. The goal is to produce quarterly estimates covering the whole economy, although the inquiry is still in the development phase and is currently of a more limited scope. Contact: Andrew Machin, tel. 02075336162 or e-mail andrew.machin@ons.gov.uk.

A new booklet How exactly are earnings measured? is in preparation. Contact: Labour Market Statistics Helpline, tel. 02075336094 or e-mail labour.market@ons.gov.uk.

a Includes those people who worked fewer hours than usual due to training courses; because they started or ended a job; bad weather;
labour disputes; economic, or other causes; personal or family reasons; those who gave another reason.

* Sample size too small for reliable estimate.

## Maternity leave question

Each spring quarter women who work fewer hours than usual because of maternity leave are asked if they take it as a legal requirement (statutory maternity leave) or as leave their employer has allowed (contractual maternity leave). The answer given is based on the respondent's own assessment. This question was introduced to the LFS in spring 1998. The number of women qualifying for maternity leave and the length of time given have been increasing over the past few years leading to greater interest in this subject.

Each quarter, the Labour Force Survey (LFS) asks people whether they worked their usual hours or not. For women, one of the main reasons for having worked fewer hours than usual is maternity leave. Table $\mathbf{1}$ gives a breakdown of the reasons by age of youngest dependent child for women, and also for men.
© In total, in spring 2001 around 9.3 million employees worked less than their usual hours.

- Two-fifths of women with dependent children aged under two who worked less than their usual hours did so because of maternity leave.
- In spring 2001, the majority of women on maternity leave were taking it as their legal entitlement ( 76 per cent) and one-fifth took it as leave allowed by the employer (see red box).
- The reasons for working fewer hours were similar in proportion for all groups except women with children under two. The most common reason, at around two-fifths, was that people's work hours varied.
- Other reasons such as holidays and sickness are subject to seasonal variations.

## Job-related training

Learning throughout working life is becoming increasingly necessary because of the pace of change within the labour market, and training is seen by a large number of employees as an essential investment for the future. Many requests for LFS data about training are received by the DfES workforce training enquiry point (0114 259 3489).
© In spring 2001, 3.7 million employees of working age received job-related training in the four weeks prior to interview, 15.4 per cent of all such employees (seasonally adjusted).
(1) A higher proportion of women than men employees had received job-related training in the past four weeks - 18.5 and 14.4 per cent (not seasonally adjusted) respectively (Table 2).

- The self-employed are the least likely to take part in job-related training - 8.0 per cent compared with 16.4 per cent of employees (Table 2).
- The age breakdown shows that the incidence of jobrelated training decreases as the age of employees increases. Employees aged 16-19 were more than twice as likely to have participated in job-related training as those aged 50-59/64 (Figure 1).
- Figure 2 shows that, generally, employees with high-level qualifications are more likely to receive jobrelated training than those with lower-level qualifications.
- Employees with a degree or equivalent were five times as likely to have reported receiving job-related training in the four weeks prior to interview than those with no qualifications.

Source: Labour Force Survey
a This table uses the National Statistics interim standard classification of ethnic groups. Therefore, previous published estimates should not be used for comparisons.
b All data in the table are provisional due to various data quality issues (see red box).
c Data are on a Great Britain basis only because 'British' and 'another White background' are not collected in Northern Ireland.
Therefore, the levels for these sub-categories do not sum to the White total.

* Sample size too small for reliable estimate.

## Changes to the ethnic group classification

From spring 200I, the LFS asks an initial question to collect Level I, with supplementary questions used to arrive at level 2 of the classification.

The main changes in responses are likely to stem from the introduction of a 'Mixed' category in the initial question. This is most likely to affect people who previously classified themselves into one of the 'Black' groups and those who previously selected the 'Other' category. Among those previously classified as 'Black-Mixed' on the old LFS classification used in publications, 85 per cent selected 'Mixed' at level I of the new question. Similarly, 79 per cent of those previously classified as 'Other-Mixed' selected 'Mixed' at the new question. Additionally, the introduction of an aggregate Asian group to the initial question will allow for some respondents to choose this category over the 'Other' category in the old ethnic classification questions.

More general information on the National Statistics interim standard classification of ethnic groups can be found on the National Statistics website at www.statistics.gov.uk/themes/compendia_reference/ articles/ns_ethnic_classification.asp.

## Quality of estimates

As with any new question in the LFS, the information could not be collected for respondents who were not contacted that quarter. Scaling factors have been applied to increase the counts in the ethnicity table such that they match population and economic activity status totals. Nevertheless, some bias is likely to remain in these provisional estimates. ONS will be carrying out further work to try to improve these estimates and to enable some historical data to be estimated on the new basis.

Further details including a table of relationships between the old and new classifications may be found in the August 2001 LFS Quarterly Supplement or the National Statistics website at www.statistics.gov.uk/themes/labour_market/download/ethnicity_changes.pdf.

From spring 2001, the LFS introduced new questions on ethnicity in line with the 2001 Census. The new National Statistics output classification has also been adopted. This has two levels: level 1 is a broad classification divided into five main ethnic groups - White, Mixed, Asian or Asian British, Black or Black British, Chinese or Other; level 2 nests within level 1 and provides a finer classification (see red box).

Table 3 shows provisional estimates (see red box) of economic activity by ethnic group at level 1 and 2 of the new classification for spring 2001.

- According to the LFS, threefifths of all those of working age from ethnic minority groups were in employment compared with threequarters of White people in spring 2001.
- Among the ethnic minority groups at level 1, the Black or Black British group had the highest working-age economic activity rate at 71 per cent and joint highest employment rate along with the Mixed group at 62 per cent.
- The Black or Black British group also had the highest ILO unemployment rate at 13 per cent. However at level 2, the Bangladeshi group had the highest ILO unemployment rate at 20 per cent - this compares with only 4 per cent for economically active White people.
- All ethnic groups had lower activity rates for women than for men, most notably the Pakistani and Bangladeshi groups ( 32 and 21 per cent for women, respectively, compared with 69 and 70 per cent for men).

A regular topic of interest among callers to the Labour Market Statistics Helpline is the labour market status of disabled people. A definition of current long-term disability including all those who report having either a current DDA-covered disability or a work-limiting disability is used to give the most comprehensive and coherent coverage of disability. Table 4 shows the economic activity status, and Figure 3 the ILO unemployment rates of people according to whether they were disabled or not.
(1) In spring 2001 there were 6.8 million people of working age with long-term disabilities in the UK, just over half of whom were men ( 53 per cent).
(1) Non-disabled people were more likely to be in employment than those who were disabled (81 per cent compared with 47 per cent).
© Disabled people in employment were slightly more likely than nondisabled people to work parttime ( 28 per cent compared with 23 per cent).
© The rates of ILO unemployment were much higher for the disabled compared with the nondisabled (9 per cent compared with 5 per cent).

- Disabled people who were unemployed were more likely than non-disabled to have been unemployed for at least a year ( 35 per cent compared with 26 per cent).
- Disabled people were much more likely to be economically inactive than non-disabled people (49 per cent overall compared with 15 per cent). The difference was greater for men ( 46 per cent compared with 9 per cent). For disabled women, the percentage who were economically inactive was higher at 52 per cent, but it was also higher for the nondisabled at 22 per cent.
- Among the economically inactive, disabled people were more likely than nondisabled people to want a job. This was true for both men and women.

Figure 4 Skill shortage vacancies and total employment by occupation; ${ }^{\text {a }}$ England; 2001

a Occupations are coded according to the 2000 Standard Occupation Classification.

Skill deficiencies are reported by an important minority of employers. The Employer Skills Survey (ESS) is the Department for Education and Skills' (DfES) main source of information on skill deficiencies reported by employers. ESS2001 covered all establishments in England (see red box) employing more than one employee, and all sectors. An understanding of skill deficiencies, their causes, characteristics and consequences can help policy makers and employers to consider and develop responses to these problems. The key findings from ESS2001 are presented below.

Table 5 shows external skillshortage vacancies by size of establishment.

- Some 4 per cent of establishments reported skillshortage vacancies (see red box) and it is estimated that there were 159,000 such vacancies across England.
- The proportion of establishments reporting vacancies, hard-to-fill vacancies, or skill-shortage vacancies rises quite sharply with the number of employed. For instance, 3 per cent of establishments with one to four employees reported skill-shortage vacancies compared with 15 per cent of those having 500 to 999 employees. Yet, because the smallest establishments are so numerous they account for 40 per cent of all skillshortage vacancies.
- There are 30 skill-shortage vacancies per thousand employees in establishments with one to four employees, but just 8 per thousand overall.

Figure 4 shows the occupational spread of these vacancies compared with the occupational distribution of employment.

- Skilled trade, associate professional and technical, and professional occupations account for more than half of all skill-shortage vacancies. The skill-shortage vacancies in these occupations were also disproportionately greater than their share of employment.

Skills shortages - Employer Skills Survey 2001 (cont.)

- The skills which employers were seeking varied with occupation. For example, advanced IT/software skills were the skills most commonly sought for professional and associate professional occupations, while for skilled trade occupations, they were technical/practical skills other than IT.

The types of skill sought for internal skill gaps by occupation is shown in Table 6.

- Some 7 per cent of employers reported internal skill gaps covering around 800,000 employees in England. Occupations in which employers were most likely to report internal skills gaps included operatives, sales and customer services staff, and managers.
- On balance, employers were more likely to cite generic skills such as communication and teamworking as skills sought for internal skill gaps, though technical/practical skills were cited as a problem for a third of all skill gaps.
- It is clear that employers perceive training to be an important cause (in terms of lack of training) and solution to skill deficiencies. The most commonly cited cause of skill gaps was a failure to develop or train staff by employers ( 35 per cent of all skill gaps), while increased training was a response of employers to 72 per cent of internal skill gaps.
- This survey suggests that skill deficiencies will continue to be experienced by employers. When employers were asked what barriers they felt prevented them from maintaining or developing a fully proficient workforce, almost a third of establishments (31 per cent) reported a lack of time for training and nearly a quarter ( 23 per cent) reported a lack of funding and a lack of cover for training respectively.

Base: Internal Skill Gaps which were followed up: employee-based measure.
Note: 'Technical skills' here comprise advanced IT and other technical/practical skills; 'generic skills' comprise communication skills, customer handling skills, team working skills, problem solving skills, basic computer literacy, management skills, numeracy skills and literacy skills.

## Employer Skills Survey (ESS)

This survey of 27,000 employers was first conducted in autumn 1999 and repeated earlier this year. The definitions of skill deficiencies used in the surveys reflect those developed by the National Skills Task Force (NSTF) and comprise two elements:
(1) external skills shortage vacancies - are vacancies proving hard to fill because applicants lack the required skills, work experience or qualifications the company demands. This definition thus excludes hard-to-fill vacancies that may have been caused by other factors such as poor terms and conditions or a low number of applicants generally.

- internal skill gaps - employers were asked 'What proportion of your existing staff at this establishment (in a particular occupation) would you regard as being fully proficient at their current job? Would you say...all of them; nearly all; over half, some but under half; very few; none of them?' Internal skill gaps were deemed to exist where employers reported that less than 'nearly all' of their employees in a particular occupation were fully proficient.

For more information on the ESS see Pp5II-5, Labour Market Trends, November 2000. Copies of the Employer Skills Survey 2001 can be downloaded from the 'Reference' section of the Skillsbase website www.skillsbase.dfes.gov.uk or are available in hard copy from: DfES Publications, PO Box 5050, Sherwood Park, Annesley, Nottingham NGI5 ODJ, tel. 084560222 60, Fax 084560333 60. # Trade union membership 1999-2000: an analysis of data from the Certification Officer and the Labour Force Survey 

By Abby Sneade, Employment Relations Directorate, Department of Trade and Industry

## Key points

## According to the Certification Officer:

- 237 trade unions submitted returns to the Certification Officer during the period I April 2000 to 3 I March 2001.
- There were 7.9 million trade union members, an increase of 46,000 on the previous year. This was the second successive year in which membership has increased.
According to the Labour Force Survey (LFS):
- At autumn 2000, 7.3 million of those in employment were trade union members, an increase of 63,000 on 1999 and an increase of 169,000 since 1998.
- On the other hand, there has been a decrease in membership since 1990 of 1.5 million, a fall over the ten-year period of 17.1 per cent.
- The proportion of employees who were union members (union density) decreased very little from 29.5 per cent in 1999 to 29.4 per cent in 2000.
- The fall in union membership has been steeper for males than for females. Male union density was 43.0 per cent in 1990 and 29.9 per cent in 2000, whereas female density was 32.0 per cent in 1990 and 28.9 per cent in 2000.
- Trade union membership is more prevalent among older employees, those with long service and those in the public sector.
- Professionals were most likely to be trade union members, as were full-time employees, foremen and supervisors, and those working in large workplaces.
- The number of employees in workplaces where trade union members are present increased by 250,000 from 11.4 million in 1999 , to 11.6 million in 2000.

## Introduction

THIS ARTICLE contains information on the number of trade unions and union members in Great Britain. There are two sources of data used to measure trade union membership. The first of these is the summary within the Annual Report of the Certification Officer (CO) for Trade Unions and Employers' Associations, collated using administrative records. The Trade Union and Labour Relations Act 1992 requires that every trade union in existence for 12 months or longer must submit an annual return to the CO. These returns provide details of the number of members within each trade union.

The second source is the Labour Force Survey (LFS) which provides more detailed information on the characteristics of trade union members. The survey includes questions on union membership status, whether a trade union is present at the workplace, and whether pay and conditions are affected by a collective agreement.

Information provided in the CO's Annual Report is based on annual returns submitted by trade unions in respect of the calendar year, although some cover a different accounting period. Approximately 88 per cent of trade unions had a reporting year that ended on 31 December 1999. The
remainder had accounting periods ended sometime between October 1999 and September 2000. The LFS currently collects data on trade unions in the autumn quarter. LFS data analysed in this article are from autumn 2000. For further discussion of the differences between the two sources of union information, see the technical note at the end of this article.

## Trade union membership data compiled by the Certification Officer

Following the proposals made last year concerning the consistency of the data used in this article, this is the first year that the statistics have been presented using the same basis as the CO's Annual Report. See technical note for a discussion of how the series used to differ and the availability of a back series for the compatible data.

Figure 1 uses data for all 'listed' and 'unlisted' trade unions that submitted annual returns to the CO. Listing is voluntary and any organisation of workers may apply to the CO to be listed as long as the organisation falls within the
definition of a trade union stated in the 1992 Act. There are organisations that fall within this statutory definition that have not applied to be listed. Any of these known by the CO are entered in a second list of 'unlisted' unions. 'Unlisted' unions have the same statutory responsibilities as listed unions; thus, the annual return forms are sent to organisations on both lists.

Figure 1 illustrates the decline in trade unions and trade union members since 1975. Mergers have caused much of the decline in the number of trade unions. There are two types of merger: transfers of engagement and amalgamations. Under a transfer of engagement, the transferring organisation loses its legal status while the organisation to which it transfers remains unchanged. An amalgamation produces a new organisation replacing each of the amalgamating bodies, which cease to exist. The data show that the period of large-scale decline has ended and that membership has begun to stabilise over the past five years.

On 31 March 2001 there were 206 'listed' unions and 22 'unlisted' unions compared with 221 'listed' unions and 22 'unlisted' unions on 31 March 2000.

The number of unions that submitted annual returns to the CO during the period 1 April 2000 to 31 March 2001 remained similar to the previous year's returns, having decreased by one union to 237. The following analysis is based solely on information from these trade unions. The number of union members increased for the second year in succession, having risen by 46,000 ( 0.6 per cent) to 7.9 million members.

Table 1 shows the distribution of members and unions by the size of union. While 72.6 per cent of unions have less than 5,000 members, 72.1 per cent of members belong to the ten largest unions with 250,000 or more members and form only 4.5 per cent of all unions. UNISON was the largest trade union with some 1.3 million members, followed by the Transport and General Workers Union ( 0.9 million members), the Amalgamated Engineering and Electrical Union (0.7 million members) and the GMB (0.7 million members).

During the period 1 January 1999 to 31 March 2000 there were nine transfers of engagement and one amalgamation. The ten mergers involved a total of 508,370 members. The largest merg-

er, which involved 486,829 members, was the amalgamation of the Banking Insurance and Finance Union, UniFI and the NatWest Association (now known as UNIFI).

## Trade union membership and density based on LFS data

Trade union membership questions were first added to the LFS questionnaire in 1989. Analysis of those in employment includes the self-
employed, but excludes members of the armed forces, who are prohibited from becoming union members, those on college-based government-supported training and employment and unpaid family workers.

Table 2 shows how in autumn 2000 union membership among those in employment was 7.3 million, a small increase of around 63,000 members ( 0.9 per cent) from 1999. This is not a statistically significant change in membership compared with 1999. Union decline is a net effect: while some members are leaving trade unions,
there are actually many thousands of new members recruited each year.
The proportion of all persons in employment who are union members (generally known as union density) remained unchanged at 27.0 per cent. The proportion of employees who are trade union members decreased marginally from 29.5 per cent in 1999 to 29.4 per cent in 2000 and does not constitute a significant change. This is because the number of employees grew at a faster rate than union membership, rising from 24.1 million in 1999 to 24.5 million in $2000 .{ }^{1}$

|  | Number of members (thousands) | Percentage change in membership since previous year | $\begin{array}{r} \text { Union density } \\ \text { for all in } \\ \text { employment (per cent) } \end{array}$ | Union density for employees ${ }^{\text {b }}$ (per cent) |

## Figure Union density; Great Britain; 1990-2000

(c) Density by type of work

(e) Density by number of employees at workplace

|990 |99| |992 |993 |994 |995 |996 |997 |998 |999 2000
(b) Density by full- or part-time work

## (f) Density by sector

The remainder of this article excludes the self-employed and covers employees only. The self-employed have traditionally had low union membership less than 10.0 per cent of the selfemployed were union members in 2000.

Figure 2 shows union density among various groups over time. Trade union density has always been higher for men than for women. However, the proportion of male employees with union membership dropped by 13 percentage points between 1990 and 2000. During the same period, female density decreased by only 3 percentage points, leaving density for both at around 30 per cent.

Union density among full-time workers fell by 11 percentage points, from 43 to 32 per cent since 1990, though the rate appears to be stabilising. The rate for part-time employees remains fairly constant over time and was 21 per cent in 2000. The large gap
between union density of full-time and part-time employees may reflect the difficulties that unions encounter in recruiting and organising part-time employees.

Manual worker union density fell from 42 per cent to 29 per cent between 1990 and 2000, while nonmanual density decreased by only 5 percentage points. Since 1996, nonmanual density has been equal to, or greater than, that for manual employees. Similarly, production density fell by 14 percentage points, from 43 to 29 per cent since 1990. Density in the service sector remained greater than for production and appeared to be stabilising at around 30 per cent. This illustrates the extent of the decline of unionisation in occupations and industries that traditionally were heavily unionised.

Union density was 36 per cent for workplaces with more than 25 employ-
ees and 16 per cent for those with less than 25 employees. The proportion of union members in the public sector was much greater than in the private sector, though both dropped at a similar rate of 4 to 5 percentage points between 1993 and 2000.

## Individual characteristics

Table 3 reveals that employees aged 40 to 49 had the highest union density of 38 per cent. Less than one fifth of 20 to 29 -year-old employees were union members, while those under 20 had the lowest density of all the age groups at 6 per cent. There is evidence from panel data that successive age cohorts had a declining probability of joining trade unions. ${ }^{2}$ Thus, the appearance of higher density in the relationship between age and union participation is mainly due to the changing labour market experiences of cohorts born in later periods.

Density was 30 per cent for White employees and 29 per cent for Black employees. Employees who belonged to Pakistani and Bangladeshi ethnic groups were least likely to be union members with a density of 16 per cent.

Union membership was most prevalent among those with higher education qualifications below degree level, at 43 per cent. For those with qualifications below this level, the proportion of union members was between 24 and 28 per cent.

Although men and women were equally likely to be trade union members, there are large differences for individual characteristics such as ethnic origin and education. Women from minority ethnic groups, most notably Black women, had a higher membership rate than their male counterparts. Women with their highest educational achievement below the standard of higher education had lower union density than men; in the case of those with at most GCSE or equivalent qualifications union density was nearly 15 percentage points less than for male counterparts. Women with higher education qualifications were far more likely than men to be union members: those with 'other' higher educational qualifications than degrees or degree equivalents had a density of 52 per cent. This
was 20 percentage points greater than the rate for men with the same academic achievements.

## Job-related characteristics

Table 4 shows that union density is related to length of service. The prevalence of union membership is greatest among those who were in their current employment 20 years ago when trade union membership was at its peak, and demonstrates a similar pattern to the distribution by age in Table 3.

Examination of the density data by occupation shows that union membership was most prevalent among professionals, half of whom were trade union members. This may have been strongly influenced by the high proportion of public sector workers such as teachers and doctors in the group: 23 per cent of all public sector employees were professionals; of these 74 per cent were trade union members. In the public sector, professionals were still most likely to be union members. However, in the private sector, plant and machine operatives had the highest density, at 36 per cent, and only 20 per cent of professionals were union members. Union density varied widely over the major occupational groups, the lowest being 11 per cent for those working in sales.

Density for full-time plant and machine operatives, personal and protective occupation group employees, and those in 'other' occupations was around twice that for part-time employees. The only group where part-time employees had higher union density than full-time employees was associate professional and technical employees.

Foremen and supervisors were more likely than managers or those with no managerial responsibility to have been union members.

The last section of Table 4 covers 'non-standard' working arrangements such as job sharing and homeworking. Full-time employees with term-time working arrangements had a higher union density than all other groups identified here. Only 7 per cent of employees who work in their own home were union members. Union density among job sharers made a small increase from 33 per cent in 1999 to 37 per cent in autumn 2000.

* Sample size too small for reliable estimate.

## Workplace characteristics

Table 5 shows that industries that were, or are, traditionally part of the public sector i.e., public administration, education, electricity, gas and water supply, had the highest union density. Overall, union density in the public sector was around three times that for the private sector.
Density in large public sector workplaces was only 11 per cent higher than for small public sector workplaces. In the private sector this difference is far more pronounced, with large work-
places having union density of over twice that of workplaces with less than 25 employees.

Figure 3 illustrates how trade union membership varies across Britain. Union density was highest in Wales and the North East ( 40 per cent) and lowest in the East of England (22 per cent).

## Trade union presence and collective agreements

Table 6 indicates no significant increase in the number of employees

who were affected by collective agreements. There was, however, a significant increase of 250,000 in the number of employees who said there were trade union members present at the workplace. Just over a third of employees' pay was affected by collective agreements, while nearly half of all employees had trade union members present at their workplace.

Comparisons cannot be made with data prior to 1999 as considerable changes were made to these LFS questions and their routing in 1999. Further details can be found in the technical note.

Table 7 illustrates that employees situated in workplaces where there were 25 employees or more were more likely to have their pay affected by collective agreements than those in smaller workplaces. The proportion of employees affected by collective agreements broadly reflects the pattern of union density shown in Table 5 with rates for the public sector being far higher than for the private sector.

Not all members of trade unions were affected by collective agreements, yet 17 per cent of those who were not members were covered by collective agreements. Only 5 per cent of employees in small private companies who were not members were affected by collective agreements, whereas in the public sector nearly half of all employees in this subset were.

## Conclusion

Union density has continued to remain at just under a third of all

employees. Both of the measures used in this article indicate that membership has ceased to decline since 1998. Data from the two sources relate to different time periods, which makes it difficult to draw firm conclusions about recent trends. Between autumn 1997 and 1998 the LFS estimate decreased by only 2,000 members and has since risen in 1999 and 2000 with increases of 105,000
and 63,000 respectively. Similarly, the CO member count has increased in 1998 and 1999 , by 51,000 and 46,000 respectively.

Density is still declining in some groups of interest such as the production industry and manual employees, though, on the whole, rates continue to vary depending upon employee and work characteristics and have remained fairly constant in recent years.

## Technical note

## The Annual Report of the Certification Officer 2000-200I

The Annual Report of the Certification Officer is not within the scope of National Statistics.

The current lists of trade unions are available for inspection, free of charge, at the Certification Office, Brandon House, I80 Borough High Street, London, SEI ILW. Requests for further information on any aspect of the Certification Officer's duties should be made to this address or telephone 02072103734 . Lists for organisations having their head office in Scotland are also available for inspection at the Office of the Assistant Certification Officer for Scotland, 58 Frederick Street, Edinburgh EH2 ILN.

## National Statistics presentation of trade union membership statistics from the Certification Officer

In previous trade union membership articles in Labour Market Trends, there have been small differences in the presentation of Certification Officer (CO) data from that shown in the CO's Annual Report:

- the Annual Report included returns for 'unlisted' unions, whereas Labour Market Trends articles did not;
- over time, CO treatment of regional branches has varied (branch members may be summed to one 'main' union), whereas Labour Market Trends articles have continued to sum regional branches until this year; and
- before 1996, Labour Market Trends (and, formerly, Employment Gazette) articles produced CO data analysis on a United Kingdom basis, while the Annual Report's coverage has always been for Great Britain.
There have also been differences in the presentation of CO data between the Annual Report, Labour Market Trends articles, and Table 7.26 published in the National Statistics publication Annual Abstract of Statistics. Table 7.26 has UK coverage, excludes unlisted unions and has never summed regional branches together. The differences between the various presentations of the CO data in the above publications are summarised in the table below.

To make these three products compatible, Labour Market Trends articles and Table 7.26 in Annual Abstract of Statistics will be presenting CO data on the same basis as the CO's Annual

Report from now on, although the Annual Abstract table will continue to have UK, rather than Great Britain, coverage. Thus, Table I is now identical to that contained within this year's Annual Report and the data behind Figure I are the same as that published in previous year's Annual Reports.

The back series for Figure I (1975-99) taken from previous years' Annual Report is available on request or can be downloaded at http://www2.dti.gov.uk/er/emar/trade_tables.htm. A back series for Table I (1989-99) of this article is also available. The latter has been estimated by the Department of Trade and Industry for the years 1989-95, using existing files and archives of annual returns available for view at the Certification Office. The total of this table for these years varies slightly from the series behind Figure I. Most of these differences are small, however, and below 5 per cent of the original CO figure. Data for the years 1996-98 are as for the table in the Annual Report.

Table 7.26 in Annual Abstract of Statistics will be revised in the next publication due in 2002.

## The Labour Force Survey (LFS)

The LFS is a survey of around 60,000 private households throughout Great Britain. The survey was conducted once every two years between 1973 and 1983 and once every year from 1983 until 1991, always in the spring. From 1992 onwards, the survey has been conducted on a quarterly basis in Great Britain, and since 1995 for the United Kingdom as a whole.

## Further differences between CO and LFS data

The CO data provide a long and consistent back series of the number of trade unions and the number of union members, from 1975 onwards. The LFS has a shorter back series, from 1989 onwards, but can provide extensive information on the respondents' individual and workplace characteristics, allowing more detailed analysis.

There are differences in how the two sources report membership. For example, the CO membership count includes all members of unions having their head office in Great Britain, including those members in Northern Ireland, the Irish Republic and 'elsewhere abroad'. These figures may also

## Technical note

include union members who are unemployed or retired. The LFS asks questions on the union status of all those in employment that are not on college-based government-supported training and employment programmes or unpaid family workers, thus excluding the unemployed and the retired.

The LFS union questions have UK coverage from 1995 onwards, although data in this article are for Great Britain to enable comparisons across a ten-year period. The LFS estimates the number of individuals who are union members, rather than the individual memberships - for example, those belonging to two unions would appear twice in the CO data, but only once in the LFS data. Also, due to the specific wording of the union question, the LFS, unlike the CO data, could count members of a staff association that was not a trade union.

## Trade union questions

In the 1999 questionnaire the union questions were altered substantially from those of previous years. The exact wording and sequence of the questions as they are now and as they were previously are as shown in the table below.

- The wording of the question that asks respondents whether they are a member of a trade union remains the same, only its place in the sequence has changed.
- The question that asks whether any of the people at the respondent's place of work are members of a trade union or staff association is designed to measure trade union presence. The wording, routing and sequence of this question has changed. Previously, it was asked of all in employment; now it is only asked to those who say that they are not union members.
- Before 1999, the question on whether the respondent's pay and conditions were directly affected by collective agree-
ments (TUCOV) was only asked where the respondent first identified unions as being present at the workplace (TUPRES), and then whether or not it was recognised (TUREC). This meant that the number of people whose pay and conditions were affected by collective agreement was an underestimate. For this reason the routing of the question was changed in the 1999 LFS and is now asked of all in employment. Users must therefore be aware that data derived from the TUCOV variable in the 1999 and 2000 datasets are not directly comparable with those of previous years due to the change in the question's coverage.
In 1992 the trade union membership question was moved from the spring to the autumn quarter. Consequently, estimates since 1992 are not directly comparable with those for earlier years, because estimates before and after this change may reflect seasonal factors as well as longer-term trends. It is not possible to seasonally adjust the data. However, it is known that, at the aggregate level, seasonal variations in the number of people in employment - the group that is asked the membership questions - tend to be relatively modest (see Employment Gazette, April and May 1993 for a fuller discussion). There is also a minor discontinuity between 1992 and 1993 due to the inclusion in 1993 of the additional questions on trade unions that preceded the membership question.

## Non-response

Each household in the LFS is in the sample for five consecutive quarters. For the small number of households that were not contactable in the quarter (other than the first), their responses from the previous quarter are brought forward. For questions that do not appear every quarter, such as the trade union membership question, there is no previous response to

## Current union questions

All in employment:
UNION
Are you a member of a trade union or staff association?

## Technical note

carry forward, and a 'does not apply' response is therefore recorded. There are also cases where the respondent was interviewed in the quarter, but gave no answer (either because they did not know, or refused to answer the question). Both cases have been treated in the same way and allocated prorata according to those who did answer the question.

## Classificatory variables

Most of the classifications used to place respondents in different categories are based on a direct question relying on the person's self-assessment of their circumstances. Some are based on a combination of more than one question, and others are coded by ONS based on standard conventions. Details are provided below.

Sex, age and ethnic group are self-defined. Highest qualification is principally based on a question asking individuals to nominate what qualifications they have from a list of 40 categories. These have then been aggregated for the purposes of analysis.

With the exception of occupation, all classifications used in this section are self-defined. In particular, it should be noted that the two aspects of employment status - full-time or parttime, and permanent or temporary - are based on direct questions and do not rely on any set criteria (e.g. number of hours worked). Whether an individual is an employee or selfemployed is also self-defined. The classification for special working arrangements only includes those who work under such arrangements, and the final category of 'work mainly in own home' is taken from a separate question on homeworking.

The occupational classifications are from the 1991 Standard Occupational Classification (SOC91), and are assigned by ONS staff based on an open-ended question asking people what their job was, and what they mainly did in their job.

Defining the sector in which people work is based on two questions, first introduced in 1993. These ask, first, if they worked in a private firm or business, a limited company, or some other kind of organisation; and second, if other, what kind of non-private organisation.

Industry is based on respondents' answers to a question about what the firm or organisation for which they worked mainly made or did, and coded using the Standard Industrial Classification of economic activities 1992 (SIC92).

Region of place of work is a self-defined variable. In earlier articles trade union density was presented by standard statistical region (SSR); since 2000 it has been by government office region (GOR). The boundaries for some of the GORs are different to the previous SSRs. The GORs North West, North

East, East of England, London and the South East are not comparable to the SSR equivalents. Users should not directly compare these regions with figures published in previous articles.

## Sampling and non-sampling error

The LFS is a sample survey and, in common with all other sample surveys, estimates are subject to sampling error and non-sampling error.

Sampling errors relate to the fact that the sample chosen is only one of a very large number of samples which might have been chosen. It follows from this that one quarter's estimate of, say, trade union membership, is only one of a large number of such estimates that might have been made. It is possible to calculate standard errors and assign confidence intervals to estimates, based on standard statistical formulae, which take into account the complexity of the sample design, the estimated proportion, the number of survey respondents and the size of the population. Generally, the more aggregated the results the lower the standard error, giving the estimate a greater degree of precision. All published LFS estimates have relative standard errors of 20 per cent or less.

Non-sampling errors are very difficult to quantify and can be minimised by achieving very high response rates, and by a concentration on quality management in the conduct of the survey and coding responses. LFS response rates are currently between 75 and 80 per cent, which is good for a household survey. Research conducted by ONS comparing the LFS with the Census of Population shows that some groups are underrepresented in the LFS sample. These include people from households living in London; those renting from a housing association; those in converted or shared accommodation; and those with only one adult, aged 16-19, in the household.

It is possible that some non-sampling error arises in the series of questions on trade unions because of measurement problems. Around a third of the sample are proxy respondents, and the data show that this group are less likely to be union members than those responding on their own behalf.

On the question of coverage of collective agreements, it is known from surveys of employers that only a small proportion of public sector workplaces are not covered, and that these arrangements are generally made at head office level or across many organisations. It is therefore likely that employees who are not union members and who work in small workplaces in the public sector may be unaware that collective bargaining arrangements apply to their organisation. Consequently there may be a downward bias to this measure.

# Some labour market implications of employment legislation 

By Tristan Slinger, Economy and Labour Market Division, Department for Work and Pensions

## Key points

Employment protection legislation sets out certain rights that employees can expect of their employers in terms of wage negotiations, working time and practice, and dismissal. These can work through a range of institutional arrangements.

- Employment legislation does not, by itself, appear to explain differences in employment and unemployment across Europe. Other factors, such as economic conditions and cultural and institutional differences also have an important influence.
- There is some evidence that more protective employment legislation reduces diversity and dynamism in the labour market by protecting particular types and forms of work. Countries with less protective legislation tend to have a wider range of working practices and a more even distribution of work across the labour force.
- More protective employment legislation thus appears to constrain the even distribution of work and efforts to reduce unemployment.

## Introduction

STRUCTURAL REFORM has been pushed to the forefront of European Union (EU) priorities. In March 2000, the Lisbon European Council set a new strategic goal for the EU "to become the most competitive and dynamic knowledge-based economy in the world, capable of sustainable economic growth with more and better jobs and greater social cohesion". ${ }^{1}$ Within this broad objective, the Lisbon Council agreed an aim to achieve an overall EU employment rate as close as possible to 70 per cent by 2010 and, for women, an employment rate of more than 60 per cent by 2010 .

More recently, the Stockholm European Council in March 2001 confirmed "the goal of full employment" ${ }^{2}$ set out at Lisbon. It supplemented the Lisbon targets with two intermediate targets of an overall employment rate of 67 per cent and a female employment rate of 57 per cent by 2005. A new target to increase the employment rate among older women and men (those aged 55 to 64 ) to 50 per cent by 2010 was also introduced.
Although much progress has been made in recent years, these aims remain challenging. In 2000, the overall employment rate in the EU was
63.1 per cent, with only four out of fifteen member states having employment rates above the 2010 target. The female employment rate was 53.8 per cent, and the employment rate for those aged 55 to 64 was just 37.5 per cent, both well short of their 2010 targets.

If these targets are to be achieved, a substantial improvement in the performance of labour markets in the EU is therefore needed. This is being taken forward across a number of areas, underpinned by the European Employment Strategy. Different member states have different labour market structures and institutions, however, and so the nature of improvements differs between member states. There is no single plan for a successful labour market.

One key labour market institution is that of employment legislation. This article, based on analysis by the Organization for Economic Cooperation and Development (OECD), looks at some of the labour market implications of employment legislation.

## Employment legislation

Employment legislation does not, by itself, determine labour market outcomes, although it obviously has some effects. The relationship between employment legislation and labour market performance and the ways that employment legislation influences the determination of employment and unemployment in different economies are very complex. Other factors, such as economic conditions, other labour market institutions and structures, and cultural differences, and the way they interact together can also have important impacts on labour market outcomes.

Employment protection legislation sets out certain rights that employees can expect of their employers in terms of wage negotiations, agreed working time and practices and regulation of dismissal. These can work through a range of institutional arrangements, including labour legislation, collective bargaining agreements and court interpretations of legislative and contractual provisions. Because the nature of employment legislation is different in
different countries, compiling a single index is necessarily a somewhat arbitrary exercise.
There are a number of methods of constructing an indicator of employment legislation, differing both in what provisions are included in the index and how different provisions are measured and then valued to provide a ranking. The construction of the OECD indicator reported here is described in Box 1 . In summary, it is built up from a range of indicators covering specific provisions with each given a score depending on the degree of protection. These indicators are then combined to give an overall score of up to six, with a higher score representing a more protective system.
This OECD indicator is more comprehensive than most others, ${ }^{3}$ as it includes indicators for collective dis-
missals and so, technically, goes beyond employment legislation. The way that OECD assesses how protective different provisions are - by looking at factors such as the length of notice periods and severance pay - also differs from other methods, such as basing rankings on employers' assessments of the restrictions they face. ${ }^{4}$ The OECD indicator used here is also more up-to-date than other indicators, covering the late 1990s.

The score for each country is shown in Figure 1. ${ }^{5}$ This suggests a broad north-south divide within the EU in the strictness of employment protection legislation. The UK has the least protective employment legislation, closely followed by the Irish Republic, Finland, Denmark and the Netherlands. The most protective legislation is found in the Mediterranean countries

## Box I The construction of the OECD indicator

The OECD analysis of employment protection legislation published in 1999 largely follows the method used in the seminal work by Grubb and Wells (1993) and later expanded in The OECD Jobs Study. This comprises a number of indicators with scores attributed to each one, allowing an overall ranking to be constructed. Many of the same indicators are used in this analysis, referring to the protection of workers against dismissal and the regulation of temporary work. A number of new indicators on the regulation of collective dismissals have also been added. This expands the overall coverage to some 22 indicators.

There are 12 indicators relating to the strictness of dismissal regulation for regular or permanent workers. These cover procedural requirements, notice and severance pay and unfair dismissal provisions. A further six indicators refer to the regulation of fixed-term contracts and temporary agency work. They cover the restrictions on the use of such employment arrangements; the definition of such cases; the sectors where they are allowed; their use over time; the possibility for renewals; and overall duration. The final four indicators measure the strictness of collective dismissal regulation. These relate to the extent to which the requirements for employers go beyond the conditions set out for individual dismissals, say in terms of notification of employee representatives, additional delays and social compensation plans.

Because of the multi-faceted nature of employment legislation and the fact that its effects can vary depending on how it is interpreted and applied, the scoring of different indicators is necessarily arbitrary. OECD has valued its indicators in terms either of units of time, such as a period of notice or months of severance pay, or of a score on an ordinal scale devised specifically for each indicator. The scores for this set of indicators are then combined to give an overall score of the relative degree of protection provided by employment legislation in each country. It should be emphasised that the method used here by OECD is one among a number of approaches, albeit the most recent and comprehensive. The OECD analysis includes a comparison of the main indicators produced on this issue.

of Portugal, Greece, Italy and Spain and also France.

## Implications for total employment

The ability of labour markets to adjust to changes in the economic climate is important to realising full employment. Flexibility in the labour market enables labour to be efficiently allocated in response to transitions in both the level and structure of demand. Labour market flexibility can, however, be achieved in a number of different ways and within a range of different welfare and labour market frameworks.

Employment protection legislation can affect the diversity and flexibility of labour markets by setting out the framework defining the determination of wages, the hiring and firing of workers, and the patterns and hours of work permissible. If more protective employment legislation reduces diversity and flexibility, it can represent a barrier to the attainment of full employment unless other labour market institutions act to counter-balance the effects of legislation.

Figure 2 shows the relationship between OECD's employment legislation score and the working-age employment rate in the 14 EU countries covered. It suggests a negative relationship, with more protective legislation associated with lower employment rates. There is not a strong correlation, however, with the countries scattered quite widely.
This reflects the OECD analysis, which found a general relationship between employment legislation and the employment rate but also that it became statistically insignificant once other factors explaining cross-country differences - such as trade union densities, benefit systems, labour market policies and economic conditions were taken into account. This implies that employment legislation does not, by itself, determine the overall employment rate.

## Implications for the diversity of work

The impact of employment protection legislation can also affect the types and patterns of work that people do, as
well as the types of people who can find and retain employment. Employment legislation typically comprises a standard definition of work (generally the traditional nine-to-five job) with the result that most jobs conform to this definition. Other types and patterns of work tend to be less common, and so people who prefer these non-standard forms of work are less likely to be in work.

Part-time work tends to be both more common and more popular in countries with less protective employment legislation. Figure 3 shows generally smaller proportions of those in employment in part-time work in countries with more protective legislation, such as in Spain, Italy, Greece and Portugal. There also tends to be greater dissatisfaction among part-time workers in countries with more protective legislation. Generally, higher proportions of parttime workers say that they work parttime because they could not find a fulltime job.

The impact of employment protection legislation on temporary work is less clear-cut. Figure 4 highlights two possible effects. Firstly, more protective legislation of permanent jobs can cause

Figure 3 Proportion of people in employment who work part-time ranked by OECD employment legislation indicator

employers to use fixed-term contracts to avoid the restrictions and the associated high costs of permanent contracts. Spain is a good illustration where a third of employees are in temporary work, of whom three-quarters said it was because they could not find a permanent job. Other countries have more restrictive legislation on fixed-term contracts and the associated high costs thus reduce the incidence of temporary work. Belgium and Italy are good examples of this with around 8 per cent of employees in fixed-term contracts. The complex interactions between legislations on temporary and permanent work, however, make the overall impact of legislation somewhat unclear.

Unlike overall employment, selfemployment tends to show a positive relationship with employment protection legislation, with self-employment more common in countries with more protective legislation. Figure 5 shows clearly, for example, that the selfemployed comprise a much larger proportion of total employment in Spain, Italy, Greece and Portugal where employment legislation is most protective. This may partly reflect workers in countries with more protective employ-
ment legislation setting up as selfemployed to avoid the costs and regulation of employee contracts. There are a large number of other factors that might also explain differences in self-employment between countries, such as different tax systems and start-up requirements.

More protective employment legislation is associated with a narrower range of hours worked, often with peaks in employees working a certain number of hours. In 1999, for example, 56 per cent of employees in Spain, 48 per cent in Portugal and 38 per cent in Italy worked 40 hours a week. In France, 37 per cent of employees worked 39 hours a week. By contrast, just 11 per cent of employees in the UK worked 40 hours a week and this was the single most common number of hours worked. ${ }^{6}$ This reflects the greater freedom of choice of hours worked (permitted by the relatively light regulation) in the UK, compared with the set number of hours worked in other countries, often defined through legislation or common agreements.

Other types of atypical or non-standard working patterns (such as shift work, working evenings and nights, and
working on Saturdays and Sundays) also tend to be less common in countries with more protective employment legislation. ${ }^{7}$

## Implications for the distribution of work

The impact of employment legislation on the diversity of employment can also be seen in the range of different people in employment. As legislation tends to cover particular types of work, it follows that the people more suited to those types of work will be at an advantage in the jobs market compared to others. People with caring responsibilities, for example, may prefer part-time employment as this allows them to combine work with caring. If legislation reduces the availability of part-time jobs, however, their employment opportunities will be reduced.

Employment protection legislation often tends to favour standard full-time work. As men have traditionally filled these jobs, this implies relatively more opportunities for men in the labour market. This is reflected in Figure 6, which

a Excludes workers self-employed in agriculture.

shows a similar proportion of prime-age men ${ }^{8}$ in work in countries with both more and less protective employment legislation. This similarity across countries implies, however, that men in countries with more protective legislation are no more likely to be in work than men in countries with less protective legislation. Employment protection legislation, therefore, does not appear to provide greater employment opportunities, even for the groups it favours.

By contrast, other groups of people, who may prefer types of work other than those typically covered by protective legislation, appear to have fewer employment opportunities and hence are less likely to be in work. Such people tend to include women, who often have to balance work with other responsibilities, and young people, who may balance work with study or may try different types of jobs to establish themselves in the labour market. Figure 7 shows that countries with more protective employment legislation tend to have much lower employment rates among both women and young people. ${ }^{9}$

## Implications for the level and concentration of unemployment

The negative relationship between employment protection legislation and employment rates is reversed with unemployment rates. Figure 8 shows generally higher unemployment rates among countries with stricter employment protection regulation. There are some exceptions, notably Portugal, ${ }^{10}$ where the unemployment rate is much lower than the employment legislation would suggest, and Finland, where unemployment is higher than it might be expected. As with the relationship with employment, however, employment protection legislation has no significant association with overall unemployment once other factors are taken into account.

Employment protection legislation also appears to influence the persistence of unemployment. Although protection tends to imply that employees are less likely to lose their jobs and so become unemployed, this protection also means
that, once unemployed, it can be very difficult to break back into the world of work. This means that unemployment can become stagnant, with much longer durations and thus higher incidences of long-term unemployment as shown in Figure 9. Again, the relationship is not an exact one with, for example, the Irish Republic having the highest proportion of long-term unemployed despite having the second least protective legislation. This is partly because other factors also determine the incidence of long-term unemployment, such as the benefits system and active labour market policies.
As with employment, unemployment also tends to be less evenly spread across the population in countries with more protective employment legislation. As protection generally covers standard, full-time work, people for whom this type of work is less suitable, such as women and young people, face reduced employment opportunities and thus are more likely to experience unemployment.

As shown in Figure 10, there is no strong relationship between the unemployment rate of prime-age men and

Sources: OECD; Eurostat Labour Force Surveys 1999

a Unemployed for 12 months or longer as a proportion of all unemployed.

the strictness of employment protection legislation, implying that protection does not appear to affect this group adversely, although neither does it appear to give them an advantage. On the other hand unemployment among women aged 15-64, and particularly among young people, tends to be much higher in countries with more protective employment legislation, suggesting that protection appears to increase their likelihood of being unemployed.

## The wider context

The relationships between employment protection and labour market performance set out in this article are fairly simple and cannot reflect the full complexities behind the determination of employment and unemployment in different economies. Other factors, such as economic conditions, labour market structures and institutions, and cultural differences, also affect labour market outcomes and therefore should also be taken into consideration.

OECD carried out more sophisticated analysis taking into account a number of other potential country-specific factors, such as the structure of wage bargaining (i.e. the degree of centralised or collective bargaining), the nature of unemployment systems (the incentive effects of benefits and spending on active labour market policies), the tax wedge and the output gap. ${ }^{11}$ These results provide more robust evidence of the existence and strength of relationships between employment protection and labour market outcomes. OECD found that total employment and unemployment are not significantly related to the degree of protection of employment legislation.

The OECD analyses did, however, indicate that more protective employment legislation does tend to produce a less even distribution of employment and unemployment among the population, influences the types of employment offered and tends to restrict the size of flows through the labour market.

## Conclusion

Employment legislation alone cannot explain differences in labour markets between countries. It is the interaction of factors such as culture and institutions with legislation, given the underlying economic conditions, that determines overall labour market outcomes in a particular country. However, there is some evidence that more protective employment legislation, by favouring particular types of work or workers, reduces diversity and dynamism in the labour market. This may, in turn, restrain the distribution of work across society through reduced opportunity and choice. Reforming employment protection legislation may help countries to move towards the Lisbon and Stockholm targets, but it appears more important that the range and type of legislation adopted in a particular country is appropriate and works well with the other labour market institutions and culture in that country.

## Notes

I From the 'Presidency Conclusions' agreed at the Lisbon European Council, 23 and 24 March 2000.
2 From the 'Presidency Conclusions' agreed at the Stockholm European Council, 23 and 24 March 2001.
3 Other indicators of employment legislation include the work by Grubb and Wells, as well as those of Lazear, Bertola, the International Organisation of Employers, EC ad hoc survey and The OECD Jobs Study. These are compared in Table 2.6 in the OECD article.
4 The indicators from the International Organisation of Employers and the EC ad hoc surveys are based on employers' assessments of the restrictions they face, e.g. in dismissing workers.

5 The OECD analysis comprised all I5 EU member states except Luxembourg.
6 Although 40 hours is the single most common number of hours worked in the UK, 18 per cent of employees work 50 hours or more (a more detailed breakdown is not available). Figures are from the Eurostat Labour Force Survey.
7 As suggested by figures from the Eurostat Labour Force Survey.
8 Prime-age here refers to those aged 25-49 years.
9 Young people are those aged I5-24 years. It should be noted that some of the international comparisons of employment rates for young people reflect the extent of participation in full-time education. Ideally, comparisons should exclude those in full-time education.

10 This reflects significant structural improvement in Portugal since the OECD indicators were produced.
II The tax wedge is the difference, in terms of wages, between the cost to the employer of employing someone and the amount that worker takes home. This reflects factors such as taxes and non-wage labour costs. The output gap is the difference between an economy's actual growth in output and its long-run trend rate of growth. It thus reflects whether an economy is growing above or below its potential. A positive output gap, for example, implies that the economy is growing faster than its long-run trend rate.

# Work-based training for young people: data from the England and Wales Youth Cohort Study 

By Joan Payne, Policy Studies Institute

#### Abstract

This study assesses the progress of young people who left full-time education at age 16 and started government-supported training or a job, and tracks their pay, qualifications and drop-out rate over the following year.

## Key points

- Some industries and occupations made much greater use of governmentsupported training (GST) than others. For Advanced Modern Apprenticeships (AMAs), starts at age $16 / 17$ were particularly concentrated in craft occupations.
- In GST, study for vocational qualifications was the norm; in non-GST jobs it was unusual.
- There were indications of inequalities in access to training by sex and ethnicity.
- AMA trainees had on average better GCSE results than young people in other GST programmes or in jobs.
- At the time of the study, off-the job training was more common in AMAs than in other GST programmes. In jobs outside GST, training provision was partial at best.
- Hourly pay was less in GST than in jobs, but higher in AMAs than in other GST.
- Young people in GST were much more likely than those in non-GST jobs to say that they had got the place they wanted.
- Most young people who got off-thejob training described it as "good" or "excellent".
- Satisfaction with training depended more on the nature of the training than on the trainee's personal characteristics. It was particularly increased by studying for level 3 qualifications and getting block release.
- Three in ten AMA trainees had left GST by age 17/I8. In other GST programmes the drop-out rate was nearly twice as high.
- The quality of the training provided was an important factor in deciding whether to stay or to leave GST.
- Drop-outs were more likely than those who stayed in GST to have poor GCSE results, to have played truant at school and to have been excluded from school.

## Introduction

THIS REPORT describes the workbased training received by young people - around a quarter of their age group who leave school at 16. It is based on Cohort 9 of the England and Wales Youth Cohort Study (YCS), a nationally representative sample of young people who finished compulsory education in summer 1997. They were first surveyed the following spring, when they were aged 16/17, and the report follows them to age 17/18, in spring 1999.

At the time of the study, Advanced Modern Apprenticeships (AMAs) were fairly well established but Foundation Modern Apprenticeships (FMAs) had only recently been launched. Most young people in gov-ernment-supported training (GST) who did not hold AMAs were in programmes that are now being phased out (known as 'other GST'), and the subsequent growth of FMAs may have changed the picture of workbased training presented here in some respects. Note also that this report only covers 16 to 18 -year-olds, whereas GST, and especially AMA, takes in young people up to age 24 . The report says nothing about the experiences of older trainees, and this should be borne in mind when considering those industries and occupations that have a disproportionate share of older GST entrants.

## Trainee characteristics

Over three-fifths of AMAs were in craft occupations. Trainees in other GST programmes had a wider range of occupations, though few held low-skilled manual jobs. The sex balance of trainees reflected this occupational distribution: around three in four AMAs were male, while in other GST programmes numbers were more even. Ethnic minority young people were heavily under-represented in AMAs but over-represented in other GST. AMA trainees on average had better GCSE results than young people in other GST programmes or in nonGST jobs.

## Receipt of training

Almost all in AMAs said that they had received some training, with nine out of ten getting training off the job. In other GST programmes more than a quarter said they had received no training at all, either on-the-job or off-the-job. In full-time non-GST jobs, half had received no training, and over twothirds had received no training off the job.

Nearly three-fifths of off-the-job training in AMAs took place in FE colleges - in other GST programmes the proportion was around a third. Block release was used more in AMAs than in other GST, but day release was quite common for both. In non-GST jobs, the employer's premises or training centre was the most common venue for off-the-job training, and day or block release was less usual.

Overall, young men were more likely than young women to get off-the-job training, but this difference disappeared after allowing (by statistical modelling) for the different proportions in AMAs and other GST and for other relevant factors such as GCSE results and home background. However, White people still got more off-the-job training than members of ethnic minorities. There were also substantial variations between occupations and industries, with below-average levels of off-the-job training in sales occupations and hotels and restaurants, and above-average levels in vehicle repairs. A parallel analysis showed that young women were less likely to get on-the-job training than young men, even after allowing for other factors. These results should be interpreted with care: for example, further investigation would be needed to judge whether any discrimination on grounds of ethnicity or gender is taking place.

## Satisfaction

Nearly three in four AMA trainees said that they had got a place in education, work or training that they wanted, compared with around three in five in other GST programmes, and one in three in full-time nonGST jobs.

A third of young people who had received off-the-job training in the previous four weeks described it as excellent, and another half said that it was good. Satisfaction was a little greater in AMAs than in other GST programmes. Statistical modelling showed that satisfaction depended more on the nature of the training received than on the trainee's personal characteristics. It was particularly increased by studying for level 3 qualifications and getting block release.

## Drop-out from GST

Over half of young people who were in AMAs in the spring after the end of compulsory education were still in AMAs one year later. Of those who had left AMA, the biggest single group had taken full-time jobs, though some had entered other GST programmes and a few had no full-time activity.

Just over a quarter of young people in other GST programmes were still in these programmes one year later. Of the rest, the biggest single group had taken full-time jobs, though some had transferred to AMA and a significant minority had no full-time activity.

In both AMAs and other GST programmes, young women were more likely to leave than young men. Poor GCSE results, playing truant at school and exclusion from school also raised the probability of leaving. Young people who had no fulltime activity after leaving were particularly likely to have these characteristics.

Young people who stayed in GST were more likely (at age $16 / 17$ ) than leavers to recall being given a training plan, to have received off-the-job and on-the-job training, to be aiming for level 3 qualifications, and to say that they had got a place in education, work or training that they wanted.

## Pay

Hourly pay in GST was well below pay in full-time non-GST jobs, though it was higher in AMAs than in other GST programmes. In GST and in jobs, receipt of off-the-job or on-the-job training was associated with lower pay. The same general pattern was found for those in GST or jobs at age $17 / 18$. However, young people in AMAs and other GST programmes at age 16/17 were more likely to increase their pay over the following year than those in non-GST
jobs at $16 / 17$. They tended to make bigger pay gains by moving out of GST and into full-time jobs than by staying in GST. Even so, those who stayed in GST still increased their pay by a greater amount on average than young people who stayed in full-time jobs, and there was no evidence that lower pay within GST encouraged young people to leave.

## Entrants to GST at age 17/18

Of young people who were in AMAs at age 17/18, 42 per cent had been in AMAs a year earlier, while 18 per cent came from other GST programmes. A further 26 per cent had been in full-time education the previous year, mostly taking vocational courses. Of young people in other GST programmes at age 17/18, 36 per cent had also been in other GST the year before, with another 33 per cent coming from full-time education, where they had usually been taking vocational courses. Overall, more young people entered AMAs than left AMAs between age $16 / 17$ and $17 / 18$. With other GST programmes, however, more young people left than joined.

## Study for qualifications

Study for qualifications - almost always vocational - was the norm for 16 to 17-yearolds in GST. AMA trainees were more likely to be aiming for level 3 than trainees in other GST programmes, though at this early stage some were still aiming for level 2 or even level 1. One year later (when most were only part-way through their programme), 45 per cent had gained a qualification, most commonly at level 2 . The proportion of trainees in other GST programmes who had gained a qualification was also 45 per cent. There was little difference between stayers and leavers from GST, or between leavers to different destinations, though stayers were much more likely than leavers to be still studying for qualifications at age $17 / 18$. By this age there was some upshifting in qualification aims, with more aiming for level 3 .

In non-GST jobs study for qualifications was unusual, and very few were studying for vocational qualifications above level 2 . Some 16 per cent had gained a qualification by age $17 / 18$.

## Conclusion

This analysis of YCS data compares the training received by $16 / 17$ year olds in AMAs, other GST (before FMA was established), and jobs outside of GST. It offers support for the view that GST has developed from an option of last resort for young people who could not get jobs elsewhere, to a provider of good training leading to vocational qualifications. At the dates to which this study relates (1997-99), work-based training was liked by most young people who took this route. Nevertheless, a number of issues remain to be tackled. Training provision in jobs outside the GST framework is partial at best. By the spring following the end of compulsory education, half of young people in full-time non-GST jobs had received no training at all, and over twothirds had received no training off the job. At the time of the study, standards of training in other GST did not match standards in AMAs in terms of amount, type and location. The progress of FMAs in remedying this situation must be monitored. There were indications of inequalities in access to high quality training by sex and ethnicity, and training providers must be alert to the possibility of discrimination. There are high drop-out rates from GST. The quality of the training provided is an important predictor of the decision to stay in GST or to leave, and young people's satisfaction with the training they receive depends more on the nature of the training than on their personal characteristics. Thus, continued improvements in training quality may help to reduce drop-out. Coping with disaffected young people who have a history of non-compliance with authority remains a serious challenge for GST.

## MAIN SOURCES

## Labour Force Survey

Much of the labour market data published are measured by the LFS. The concepts and definitions used in the LFS are agreed by the International Labour Organization (ILO), an agency of the United Nations. The definitions are used by European Union member countries and members of the Organisation for Economic Co-operation and Development.
The LFS is the largest regular household survey in the United Kingdom. In any three month period, a nationally representative sample of approximately 120,000 people aged 16 or over in around 61,000 households are interviewed. The survey also covers students in halls of residence (who are sampled in their parental residences) and people living in NHS accommodation. Each household is interviewed five times, once every three months. The initial interview is generally done face-to-face by an interviewer visiting the address. Further interviews are done by telephone wherever possible. The survey asks a series of questions about respondents' personal circumstances and their labour market activity, with most questions referring to activity in the week before the interview. The first and fifth interviews also ask about earnings. Interviews are carried out continuously throughout the year and key results are published every month for the latest available three month period. Other data are available once a quarter or once or twice a year.
The LFS was carried out every two years from 1973 to 1983. The ILO definition was first used in 1984. This was also the first year in which the survey was conducted on an annual basis with results available for every spring quarter (March to May). The survey moved to a continuous basis in spring 1992 in Great Britain and in winter 1994/5 in Northern Ireland, with results published four times a year. Since April 1998, results are published 12 times a year for an average of each threemonth period. LFS data are published around six weeks after the period to which they refer.

The LFS three-monthly results can be compared in various ways over time, shown by the chart below. The shaded areas show the periods for which LFS results are available. Comparisons over time should be made with the periods shaded in the same patterns, e.g. J anuary to March 2000 should be compared with J anuary to March 1999 or October to December 1999. Comparing estimates for overlapping three-month periods can produce more volatile results which can be difficult to interpret. In order to make three-month on three-month comparisons, it is important to use seasonally adjusted data. The LFS household datasets are designed specifically to be used for analysis at the
household and family level. A technical report in Labour Market Trends of August 1998 describes why and how they have been produced.

## Employer surveys

ONS conducts a range of employer surveys, collecting information on their turnover and profits, and also the number of filled jobs.

The Annual Business Inquiry (ABI) is conducted in December to measure the number of employee jobs. The survey samples around 78,000 reporting units of workplaces situated in the United Kingdom. As well as measuring employee jobs, the ABI also collects financial information from the same set of units. Therefore, figures derived from both parts of the survey (e.g. turnover per head) are consistent.

Short-Term Turnover Employer Surveys are smaller surveys which are conducted every three months. The surveys are used to provide estimates of quarterly changes in the number of jobs between the annual surveys. For production industries surveys are conducted monthly, allowing estimates to be produced for each month. Around 9,000 production enterprises are sampled each month.

Both the ABI and the Short-term Turnover Employer Surveys take a sample of businesses from the InterDepartmental Business Register (IDBR). The IDBR holds details of all businesses that run a PAYE tax system or register for VAT.

The Monthly Wages and Salary Survey covers a sample of firms in Great Britain. The survey obtains details of the gross wages and salaries paid to employees, in respect of the last pay week for the weekly paid, and for the calendar month for the monthly paid. The sample covers the wage bill for some 9 million employees. It is used to calculate the Average Earnings Index.

## Administrative records

Labour market data on the number of people claiming unemployment-related benefits and Jobcentre vacancies are derived from administrative records.

Claimant count data are provided by the Benefits Agency. Jobseeker's Allowance (JSA) replaced both Unemployment Benefit and unemployment-related Income Support on 7 October 1996. Up to 6 October the claimant count figures included those who claimed Unemployment Benefit, Income Support or National Insurance credits. A seasonally adjusted consistent claimant count series is available from 1971. The claimant count records the number of people claiming unemployment-related benefits on one particular day each month. Claimant count figures are announced five weeks after the date to which they refer.

Data on vacancies are produced by the Employment Service (ES) as a by-product of its Labour Market System (LMS). LMS is the computer system that manages the currency of vacancies on display, controls their circulation around Jobcentres, and identifies those for liaison action with employers. A consistent vacancies series is available from 1985.

## USING DATA SOURCES

Because the different sources of labour market data have different strengths and limitations, it follows that they are best used for different purposes. This section identifies the source of data that ONS recommends using for different types of analysis of three aspects of the labour market: employment, unemployment, and earnings.

## Employment

The LFS provides a more complete measure of employment than the workforce jobs series, but the workforce jobs series probably provides a more accurate industrial breakdown than the LFS.
To gain an idea of the extent of work being performed in the UK, the LFS is preferred. The LFS is also the only source of detailed information about the characteristics (occupations, homeworking, work patterns and so on) of people's work - except for the industry in which people work, where the workforce jobs series is likely to be more accurate, and consistent with other national economic series.

## Unemployment

The LFS provides a more complete measure of unemployment (under the ILO definition) than the claimant count (which measures benefit receipt), especially for women, and is better-suited to international comparisons. The claimant count is more useful as a way of assessing unemployment in small areas (below the level of regions); it is also useful as a timely indicator of up-to-date changes in unemployment.

## Earnings

For monthly estimates of changes, the Average Earnings Index is most suitable. For annual changes, the New Earnings Survey should be used. For estimates of levels (amounts workers earn each week or each hour), the sources are the NES and LFS. The NES is preferred as a source of the earnings of full-time employees, and of the hourly earnings of all employees. The LFS is preferred as a source about the earnings of part-time employees. LFS earnings estimates are published in the LFS Quarterly Supplement.

|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## EMPLOYMENT

## Employment

There are two ways of looking at employment: the number of people in employment or the number of jobs. These two concepts represent different things, as one person can have more than one job (see 'Comparison of sources of employment data', Labour Market Trends, December 1997, pp511-16 for more details of differences between the two sources). People aged 16 or over are classed as employed by the Labour Force Survey (LFS), if they have done at least one hour of work in the reference week or are temporarily away from a job (e.g. on holiday). People classify themselves into one of four categories in the LFS (according to their main job if they have more than one): employees, selfemployed, unpaid family worker (doing unpaid work for a family-run business) or participating in a governmentsupported training programme.

## Workforce jobs

The number of jobs is mainly collected through postal employer surveys (see notes on sources). This gives the number of employee jobs (formerly known as employees in employment). The total number of workforce jobs (formerly known as workforce in employment) is calculated by summing employee jobs, self-employment jobs from the LFS, those in HM Forces and government-supported trainees. As the main part of the estimate is the employee jobs total, this classification represents the employers' perception of how many jobs there are. It excludes homeworkers and private domestic servants.

## Self-employed people (LFS)

Those who, in their main job, work on their own account, whether or not they have employees.

## Self-employment jobs

Part of the total workforce jobs. Includes self-employed people in their main job and people who are employees in their main job who are self-employed in their second job (from the LFS).

## Government-supported trainees

Those on government-supported training programmes are included in the employee jobs estimate if they have a contract of employment. If, however, they do not have a contract of employment they are included in the workforce jobs estimate as government-supported trainees.

## Employment rate

Employment rates can be presented for any population group as the proportion of that group who are in employment. The main presentation of employment rates is the proportion of the population of working age ( $16-59$ for females and $16-64$ for males) who are in employment.

## UNEMPLOYMENT

## ILO unemployment

The International Labour Organisation (ILO) definition of unemployment covers people who are: out of work, want a job, have actively sought work in the previous four weeks and are available to start work within the next fortnight; or out of work and have accepted a job that they are waiting to start in the next fortnight.

Count of claimants of unemploymentrelated benefits (claimant count)
The claimant count records the number of people claiming unemployment-related benefits. These are currently the J obseeker's Allowance ( SA ) and National Insurance credits, claimed at Employment Service local offices. People claiming J SA must declare that they are out of work, capable of, available for and actively seeking work during the week in which the claim is made. They enter into a J obseeker's Agreement setting out the action they will take to find work and to improve their prospects of finding employment.

## The terms used in the tables are

 defined more fully in the periodic articles in Labour Market Trends that relate to particular statistical series
## ILO unemployment rate

The percentage of economically active people who are unemployed on the ILO measure. Can be calculated for any population group.

## C laimant count rate

The number of claimants resident in an area expressed as a percentage of the sum of claimants and workforce jobs in the area.

## ECONOMIC ACTIVITY

## Economically active

The economically active population are those who are either in employment or ILO unemployed.

## Economic activity rate

The number of people who are in employment or unemployed as a percentage of the total population aged 16 and over. Can be calculated for any population group.

## ECONOMIC INACTIVITY

## Economically inactive

Economically inactive people are out of work, but do not satisfy all the criteria for ILO unemployment, such as those in retirement and those who are not actively seeking work.

## Economic inactivity rate

The number of economically inactive people as a percentage of the total population aged 16 and over. Can be calculated for any population group.

## EARNINGS

## Earnings

A measure of gross remuneration people receive in return for work done. It includes salaries and bonuses but does not include non-monetary perks such as benefits in kind. This differs from income, which is the amount of money received from all sources. Income includes interest from building society and bank accounts, dividends from

## CONVENTIONS <br> The following standard symbols are used: <br> .. not available <br> - nil or negligible (less than half the final digit shown) <br> P provisional <br> - break in series <br> R revised <br> r series revised from indicated entry onwards <br> nec not elsewhere classified <br> SIC UK Standard Industrial <br> Classification <br> EU European Union

Where figures have been rounded to the final digit, there may be an apparent slight discrepancy between the sum of the constituent items and the total as shown. Although figures may be given in unrounded form to facilitate the calculation of percentage changes, rates of change etc by users, this does not imply that the figures can be estimated to this degree of precision, and it must be recognised that they may be the subject of sampling and other errors.
shares, benefit receipts, trust funds, etc. It should be noted that the Average Earnings Index excludes bonuses at the more detailed industry levels shown in Table E.2, in order to reduce volatility in the Index.

## Average Earnings Index

Average earnings are obtained by dividing the total paid by the total number of employees paid, including those on strike. The headline rate is the change in the average seasonally-adjusted index values for the last three months compared with the same period a year ago, and replaces the underlying rate of change.

## HOURS WORKED

(New Earnings Survey)

## Normal weekly hours

The time which an employee is expected to work in a normal week excluding all overtime and main meal breaks.

## Weekly hours worked

The actual hours worked during the reference week and hours not worked but paid for under guarantee agreements.

## HOURS WORKED

## (Labour Force Survey)

Respondents to the LFS are asked a series of questions enabling the identification of both their usual hours and their actual hours during the reference week, excluding meal breaks, but including paid and unpaid overtime.

## OTHER DEFINITIONS

## General index of retail prices

The Retail Prices Index measures the change in the prices of goods and services bought for the purpose of consumption by the vast majority of households in the UK. The general index includes virtually all types of household spending as detailed in Table H.12.

## Labour disputes

Statistics cover disputes (strikes) connected with terms and conditions of employment. Workers involved and working days lost relate to persons both directly and indirectly involved at the establishments where the disputes occurred.

## Productivity

The number of units of output (measured by the Index of Production for the manufacturing sector and by Gross Domestic Product for the whole economy) produced by each filled job.

## Standard Industrial Classification (SIC)

The classification system used to provide a consistent industrial breakdown for UK official statistics. It was revised in 1968, 1980 and 1992. The SIC 1992 classification splits businesses into 17 sections, $\mathrm{A}-\mathrm{Q}$. The breakdown includes the following categories: production industries - SIC 1992 Section E including manufacturing (Section D); service industries - SIC 1992 Sections G-Q.

## Standard Occupational Classific ation (SOC)

The classification system used to provide a consistent occupational breakdown for UK official statistics. This system was introduced in 1991. The revised classification (SOC2000) replaced SOC90 in the LFS from spring 2001.

## Unit wage costs

A measure of the cost of wages and salaries in producing a unit of output.

## J obcentre vacancies

A job opportunity notified by an employer to a Jobcentre or careers office (including 'self-employed' opportunities created by employers) which remained unfilled on the day of the count.

## COMPARISONS OVER TIME

ONS recommends that non-overlapping periods are always used for comparisons over time.
The sample design of the LFS enables estimates for any three consecutive months to be calculated. ONS began publication of these estimates in April 1998. The most reliable comparison is one between non-overlapping periods. For the latest data, compare the data from three months previously e.g. December to February data with that for September to November rather than November to January. Due to the overlap of two months, the latter comparison would actually just compare the single months of November and February, but the data are not robust enough to make this comparison. This can lead to unreliable conclusions about change. For further details see article by Richard Laux, pp59-63, Labour Market Trends, February 1998.

## SAMPLING VARIABILITY OF LABOUR FORCE SURVEY DATA

LFS data are based on statistical samples (see Sources, pS 2 ) and, as such, are subject to sampling variability. If we drew many samples, each would give a different result. The ranges shown for the LFS data in the table below represent ' 95 per cent confidence intervals'. We would expect that in 95 per cent of samples the range would contain the true value. The ranges are approximated from not seasonally adjusted data for Apr-June 2001 in line with research on the topic. For more information, see the Guide to Labour Market Statistics Releases, or the LFS Quarterly Supplement.

| UNITED KINGDOM SEASONALLY ADJUSTED | Level | Sampling variability | Change on quarter | Sampling variability | Change on year | Sampling variability |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Inemployment (000s) | 28,175 | $\pm 161$ | 75 | $\pm 117$ | 250 | $\pm 206$ |
| Employment rate | 74.8\% | $\pm 0.4 \%$ | 0.0\% | $\pm 0.3 \%$ | 0.2\% | $\pm 0.5 \%$ |
| ILO unemployment (000s) | 1,484 | $\pm 51$ | -14 | $\pm 53$ | -134 | $\pm 70$ |
| ILO unemployment rate | 5.0\% | $\pm 0.2 \%$ | -0.1\% | $\pm 0.2 \%$ | -0.5\% | $\pm 0.2 \%$ |
| Economically active (000s) | 29,659 | $\pm 159$ | 61 | $\pm 116$ | 116 | $\pm 203$ |
| Economic activity rate | 78.8\% | $\pm 0.3 \%$ | 0.0\% | $\pm 0.2 \%$ | -0.2\% | $\pm 0.4 \%$ |

For more detailed analyses, please see the Labour Force Survey Quarterly Supplement.
Note: Following the introduction of the Local Labour Force Survey (see article pp195-9, Labour Market Trends, May 2000), the survey design for the main Labour Force Survey has changed from June 2000. There will be more interview areas from which interviews will be selected. In the short term (i.e. from April to June 2000 until August to October 2001) it is predicted that there will be a very slight increase in standard errors across measures of employment, ILO unemployment and economic inactivity (expected to be no bigger than 4 per cent), as the survey methodology switches from old to new interview areas. After that period there will be a decrease in those standard errors because of the increase in the number of interview areas, leading to improved stratification of the sampling. There will be no impact on the levels, rates or changes in LFS data; there will only be an impact on standard errors. For more information see article by Dave Elliot in the July 2000 edition of the ONS Survey Methodology Bulletin, or contact Adrian Jones, tel. 02075336133.

## A LABOUR MARKET SUMMARY Labour Force Survey trends series: employment and unemployment - technical note

Trends indicating the underlying movement of the series, after factors such as seasonality and irregular values have been removed, are shown in the graphs below. The trends are estimated using a standard approach adopted by ONS, based on the results of its short-term trends research project. In this case, the recommended method is to apply a 13 -term Henderson moving average, augmented by two stages of outlier detection and ARIMA modelling, to the seasonally adjusted series. For more information, see An Investigation of Trend Estimation Methods, available from the Time Series Analysis Branch (020 7533 6236).

Estimates of the trends at the end of the series are subject to revision when new data become available. The graphs below give an indication of the likely extent of these revisions. They have been constructed by making statistical estimates of the range of values within which the next data point in the series is likely to fall. The resultant extended series have been used to calculate the corresponding likely range of revised trend estimates. Note that this range does not take account of revisions which might arise from seasonal adjustment.

There is a margin of error surrounding the trend estimates, particularly at the end of the series. The trend can be used to get a general impression of the underlying trend behaviour of employment, or ILO unemployment, but month-on-month changes in the trend numbers should not be reported.

For further information, please see the article on pp431-6, Labour Market Trends, August 1999.

b Market Trends, April 1999
Levels are for those aged 16 and over and rates are for those of working age
Note: and rates are for those aged 16 and over. The rate is as a proportion of the economically active
There is a margin of error surrounding the trend estimates, particularly at the end of the series. The trend can be used to get a general impression of the underlying behaviour of employment, or ILO unemployment, but month-on-month changes in the trend numbers should not be reported. For more information, seetechnical note on pS12

Labour Market Statistics Helpline:02075336094
Relationship between columns: $2=4+5=6+12 ; 6=8+10 ; 12=14+16$.

[^10]c Quarter to quarter changes at regional level are particularly subject to sampling variablility and should be interpreted in the context of changes over several quarters rather than in isolation.
The Labour Force Survey is a survey of the population in private households, student halls of residence and NHS accommodation.

Relationship between columns: $1=2+3 ; 4=6+8$.
d The vacancy data for Northern Ireland have been suspended since March 1999.
e National and regional claimant count rates are calculated by expressing the number of claimants as a percentage of the estimated total workforce (the sum of claimants, employee jobs, self-employed, HM armed forces and government-supported trainees) at mid-1999 for 1999 and 2000 figures and at the corresponding mid-year estimates for earlier years.

TECHNICAL NOTE: LABOUR FORCE SURVEY SAMPLING VARIABILITY - April to June 2001

|  | Employment level(000s) | ILO unemployment level(000s) level(000s) | Economically active level(000s) | Working age economically inactive level(000s) | Employment rate (\%) | unemployment rate (\%) | The Labour Force Survey data in table A. 11 are based on statistical samples and, as such, are subject to sampling variability. If many samples were drawn, each would give a different result. The ranges shown for the LFS data in this table |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |  |  | represent ' 95 per cent confidence intervals'. It is |
| NorthEast | $\pm 34$ | $\pm 12$ | $\pm 34$ | $\pm 35$ | $\pm 1.8 \%$ | $\pm 1.0 \%$ | expected that in 95 per cent of samples the range |
| North West | $\pm 58$ | $\pm 18$ | $\pm 58$ | $\pm 57$ | $\pm 1.1 \%$ | $\pm 0.5 \%$ | would contain the true value. The ranges are |
| Yorkshire andthe Humber | $\pm 47$ | $\pm 15$ | $\pm 46$ | $\pm 46$ | $\pm 1.2 \%$ | $\pm 0.6 \%$ | approximated from not seasonally adjusted data |
| EastMidlands | $\pm 43$ | $\pm 14$ | $\pm 43$ | $\pm 41$ | $\pm 1.3 \%$ | $\pm 0.7 \%$ | in line with research on the topic. For more |
| WestMidlands | $\pm 48$ | $\pm 16$ | $\pm 48$ | $\pm 47$ | $\pm 1.2 \%$ | $\pm 0.6 \%$ | in line with research on the topic. For more |
| East | $\pm 47$ | $\pm 14$ | $\pm 47$ | $\pm 43$ | $\pm 1.0 \%$ | $\pm 0.5 \%$ | information, see the Guide to Labour Market |
| London | $\pm 60$ | $\pm 21$ | $\pm 58$ | $\pm 57$ | $\pm 1.1 \%$ | $\pm 0.6 \%$ | Statistics Releases. |
| SouthEast | $\pm 58$ | $\pm 15$ | $\pm 57$ | $\pm 52$ | $\pm 0.9 \%$ | $\pm 0.4 \%$ | Following the introduction of the Local Labour |
| SouthWest | $\pm 46$ | $\pm 12$ | $\pm 46$ | $\pm 43$ | $\pm 1.1 \%$ | $\pm 0.5 \%$ | Force Survey, the survey design for the main |
| Wales | $\pm 37$ | $\pm 12$ | $\pm 36$ | $\pm 38$ | $\pm 1.7 \%$ | $\pm 0.9 \%$ | Labour Force Survey has changed, from June |
| Scotland | $\pm 46$ | $\pm 16$ | $\pm 45$ | $\pm 44$ | $\pm 1.2 \%$ | $\pm 0.6 \%$ | 2000, temporarily increasing standard errors. See technical note, pS12 |

Source:Benefits Agency administrative system
National and regional claimant count rates are calculated by expressing the number of claimants as a percentage of the estimated total workforce (the sum of claimants, employee jobs, self-employment
jobs, HM armedforces and government-supported trainees) at mid-2000 for 2000 and 2001 figures and at the corresponding mid-year estimates for earlier years.
b The seasonally adjusted series takes account of past discontinuities to be consistent with the current coverage of the count (see Employment Gazette, December 1990 , p608 for the historical list of discontinuities taken into account, and pS 6 of the April 1994 issue). It also takes into account the effect of the change in benefit eligibility rules introduced with Jobseeker's Allowance (see Labour Market Trends,May 2000 pp219-24). To maintain a consistent assessment, the seasonally adjusted series relates only to claimants aged 18 and over.
\(\mathrm{P} \quad\) The latest national and regional seasonally adjusted claimant count figures are provisional and subject to revision, mainly in the following month.
Note: The introduction of Joint Claims for Jobseeker's Allowance, on 19 March2001, has had an upward effect on the claimant count since April 2001 . ONS estimates the cumulative impact on the count for June
to be 6,000 for the UK overall ( approximately 2,000 men and 4,000 women). to be 6,000 for the UK overall ( approximately 2,000 men and 4,000 women).
The introduction of Joint Claims meansthat both members of certain couples are now required to claim JSA jointly and both are required to look for work. This applies to couples without dependent children
where at least one member was born after 19 March 1976 and is aged over 18. The claimant count continues to include all individual claimants, so there are some extra claimants included as a result of this change.

\footnotetext{
Note: Only computerised claims are analysed by age and duration on a monthly basis. These figures therefore differ in total from those given in Table C.11. The latter include clerically processed claims which currently amount to less than 1 per cent of the total claimant count.

Anoccasional supplementary analysis by age and duration of the full claimant count including 6,000 clerical claims for April 2001 is available. For further details see pp365-9.This is also available on the National
}

a Travel-to-Work Areas (TTWAs) are as defined in May 1998. A list of the ward composition of the TTWAs is available from Regional and Local Statistics division on 02075336114.
b Claimant count rates are calculated by expressing the number of claimants as a percentage of the estimated total workforce (the sum of claimants, employee jobs, self-employment jobs, HM armed forces and government-supported trainees) and as a percentage of the narrow-based estimate (claimants plus employee jobs). All the rates shown are calculated using mid-2000 based denominators.

Note: Rates for the above TTWAs back to January 1996 and rates for the 1984 TTWAs are available from the National Statistics Nomis \({ }^{\circledR}\) database. Data on claimant count for Assisted Areas, which were redefined on 1 August 1993, are available from the National Statistics Nomis \({ }^{\circledR}\) database.

\end{tabular}

\footnotetext{
a Claimant count rates are calculated by expressing the number of claimants as a percentage of the estimated total workforce (the sum of claimants, employee jobs, self-employment jobs, HM armed forces and governmentsupported trainees) and as a percentage of the narrow-based estimate (claimants plus employee jobs). All the rates shown are calculated using mid-2000 based denominators.
Note: This table gives data using the Eurostat Nomenclature des Unités Territoriales Statistiques (NUTS) system. NUTS 2 areas are in bold type, and NUTS 3 areas are indented and in lighter type. For more information, see Labour Market Trends, July 1999, p335.

Note: This analysis has been obtained from the claimant count cohort, a 5 per cent sample of all computerised claims.
Latest' claims in this table started between 12 April 2001 and 12 July 2001 inclusive
Previous' claims in this table musthave started after 11 April1999.
The widest \(95 \%\) confidence interval for the regional percentages is \(\pm 2.0\) percentage points (Wales)
The widest \(95 \%\) confidence interval for the male/female percentages is \(\pm 1.0\) percentage points.
All claims have been grossed by a factor of 20 to represent the population.
Destination of leavers from the claimant count by duration of claim
Leavers between 14 June 2001 and 11 July 2001, not seasonally adjusted

\end{tabular} ILO unemployment as a percentage of the labour force. The standardised ILO rates shown are sourced from ONS (for the UK) and the OECD (for all other countries) and are the most suitable rates for
making international comparisons. The rates for all countries apart from Switzerland are based on Labour Force Survey data. For Switzerland, the rates are based on registered unemployment. making international comparisons. The rates for all countries apart from Switzerland are based on mendoyment rate for the UK is an average for 3 months centred on the middle month
 . And a combination of LFS and registered unemployed for the Netherlands. The rate of other complementary
and the self employed for Austria.
and the self employed for Austria. measures of unemployment excludes: the armed forces for Australia, Canada, Germany and the USA; conscripts for Finland, Italy; those aged 65 and over in Ireland;
The rate of other complementary measures of unemployment for France and Ireland is derived from the LFS and from registered unemployed.
The seasonally adjusted and unadjusted rates of other complementary measures of unemployment refer to June for Australia, Austria, Canada, Finland, Germany, Ireland, Switzerland and Sweden. For Belgium, Denmark and Netherlands, both the unadjusted and seasonally adjusted rates refer to May. For Japan, the adjusted rate refers to May while the unadjusted refers to June.

\footnotetext{
a As a result of a change in the survey questionnaire the series excluding bonuses are subject to a discontinuity between January and February 1999. See article on pp267-8 of the May 1999 issue of Labour Market Trends for further details.
As a result of a discontinuity in the reporting of data for the agricultural sector, this series is not available before August 1999. Therefore there is no index for this series based on March 1996 as with the Ther index for the sector education, health and social work is based on a sample which excludes representatives of the private health and social work sector until June 1998. Monthly movements in the index for this sector therefore exclude private health and social work up to May 1998. Excluding sea transport.
Excluding private domestic and personal services.
Note: The data contained in this table are not comparable with those previously published in Table E.3. Excluding bonuses and averaging the data over a three-month period render the data fundamentally different to the previous indices which included bonuses and related to single months only
\(\begin{array}{ll}\text { R } & \begin{array}{l}\text { Revised } \\ \text { Provisional }\end{array}\end{array}\)
}

Average Earnings Index: all employee jobs: by industry
(three-month averages, \({ }^{\text {b }}\) unadjusted): excluding bonuses

These tables present the results of projecting the April 2000 New Earnings Survey (NES) to April 2001.

\section*{Estimated average earnings in April 2001}

It is estimated that the average gross weekly earnings of fulltime adult employees in April 2001 were \(£ 430.1\). The tables show the detailed figures for nine occupation groups (and manual/non-manual), selected industry groups, and Government Office Regions.

For categories not shown in the tables, users can construct their own April 2001 projections by applying the appropriate multiplier from Box 1 to the NES estimates for April 2000.

The multipliers are produced by scaling the equivalent \(3 \times 3\) table of annual increases in weekly earnings obtained from the 1999 and 2000 New Earnings Survey so that the overall increase (which was 2.3 per cent) equals the 4.75 per cent increase in the Average Earnings Index (AEI) between April 2000 and April 2001. The AEI used is an unpublished series that excludes arrears of pay.

Table A Average gross weekly earnings for full-time employees on adult rates;
Great Britain; April 2001

Wages and salaries per unit of output. Provisional
Note
Manufacturing estimates are based onthe seasonally adjusted monthly index of average earnings, manufacturing productivity jobs and the manufacturing index of production. Whole economy estimates are based on gross value added at basic prices, total wages and salaries, and productivity jobs.

The full productivity and unit wage costs data sets with associated articles can be found on the National Statistics website at www.statistics.gov.uk/themes/economy/Articles.asp under 'Productivity'.

a Figures refer to the last Friday of each quarter/month.
Those identified by ES as having joined New Deal, including those who have received an initial invitation, but not yet attended their first interview.
Those who have left during Gateway either to go into an unsubsidised job or for some other reason, plus those who have left an option without returning to ES.
e Totals include those whose sex is not recorded. For this reason, and also because of rounding, components will not necessarily sum to totals.
For further information, please see article on pp197-206, Labour Market Trends, April 1999.

Source: Research and Development Division, EmploymentService; and Department of Enterprise, Trade and Investment forNorthern Ireland \(\begin{array}{r}\text { Enquiries: } 01142596365\end{array}\)
a Includes those leaving before receipt of a first interview.
b Those who are recorded by ES as having been placed into unsubsidised employment, plus those who are recorded as having terminated their Jobseeker's Allowance (JSA) claim in order to go into a job. This will undercount the total number going into a job: some who go into a job will not, for whatever reason, record this as the reason for termination of their JSA claim. These will be counted as not known. Evidence suggests that a significant proportion of those recorded as destination not known who are later contacted in follow-up surveys, find work.
c Where there is no leaving code recorded on JUVOS, or where the leaving code is recorded as 'not known', or simply 'ceased claiming' or 'failed to attend'.

For further information, please see article on pp197-206, LabourMarket Trends, April 1999.

Source: Research and Development Division, Employment Service
Enquiries: 01142596365
a Includes those leaving before receipt of a first interview.
b Those who are recorded by ES as having been placed into unsubsidised employment, plus those who are recorded as having terminated their JSA claim in order to go into a job. This will undercount the total number going into a job: some who go into a job will not, for whatever reason, record this as the reason for termination of their JSA claim. These will be counted as 'not known'.
C Where there is no leaving code recorded on JUVOS, or where the leaving code is recorded as 'not known', or simply 'ceased claiming' or 'failed to attend'. As more data are added, the numbers in this category may be revised downwards.
e At the end of the advisory process, clients may return to normal jobseeker activity including regular fortnightly reviews.
For further information, please see article on pp197-206, Labour Market Trends, April 1999.

\end{tabular}
a Excluding vacancies on government programmes (except vacancies on Enterprise Ulster and Action for Community Employment (ACE) which are included in the figures for Northern Ireland).
b Datafrom May 2001, particularly unfilled stocks, outflows and placings, are affected by new Employment Service procedures. See notes to table G3
P The latest national and regional seasonally adjusted vacancy figures are provisional and subject to revision, mainly inthe following month.
Note: For further information, please see the article ‘Jobcentre vacancy statistics’ on pp159-162, Labour Market Trends, March 2001.
Vacancies notifiedto and placings made by Jobcentres do not represent the total number of vacancies/engagements in the economy. Latestestimates suggest that about a third of all vacancies nationally are notified to Jobcentres; and about a quarter of all engagements are made through Jobcentres. Inflow, outflow and placings figures are collected for four or five-week periods between count dates; the figures

The vacancy data for Northern Ireland have been suspended since March 1999 and the figures between March and April 1999 and between September and October 1999 for Great Britain have been affected by corrections by the Employment Service to the recorded stock of unfilled vacancies. There has also been a minor change in the definition of notified vacancies between April and May 2000 . See notes to TableG.3.

a Excluding vacancies on government programmes (except vacancies on Enterprise Ulster and Action for Community Employment (ACE) which are included in the figures for Northern Ireland)
b About one third of all vacancies nationally are notified to Jobcentres. These could include some that are suitable for young people and similarly vacancies notified to careers offices could include some for adults. The figures represent only the number of vacancies notified by employers and remaining unfilled on the day of the count. Because of possible duplication and also due to a difference between the timing of the two counts, the two series should not be added together.

Note: For further information, please see the article 'Jobcentre vacancy statistics’ on pp159-162, Labour Market Trends, March 2001.
The publication of the vacancy figures for Northern Ireland has been suspended since March 1999 as a result of a discontinuity identified during the introduction of a new compute system for processing vacancies to local offices of the Department of Higher and Further Education, Training and Employment (DHFETE). In the course of correcting for this difficulty, further problems of a procedural nature have also come to light as contributory factors. These further issues have delayed the re-instatement of published vacancy figures for Northern Ireland. DHFETE have now introduced a new internet-based operational systemfor vacancies and are investigating how the statistics might be resumed using this. The series will be reinstated as soon as possible. For the purposes of the seasonally adjusted United Kingdom figures it has been assumed provisionally that the Northern Ireland figures placings. These are not estimates for Northern Ireland but assumptions for the purpose of continuity of the United Kingdom series.

The vacancy stock figures for Great Britain have been affected by corrections to the data by the Employment Service to make up for the gradual build-up of inaccuracies. The figures were corrected on 8 October 1999 to give a true reflection of the number of open vacancies held by the Employment Service. This had an upward effect of some 10,300 on the recorded stock of unfilled vacancies for Great Britain between September and October 1999 and there was a corresponding downward adjustment to the outflow for October, but not to the placings. There was a similar upward correction to the vacancy stocks (and a downward effect on the outflow) of 9,100 between March and April 1999 .

There was minor discontinuity due to a change in the treatment of vacancies by the Employment Service between April and May 2000. As from 7 April both vacancies notified and placings are only counted in the statistics if the vacancy concerned is for 8 hours or more in a 7 -day period. Previously vacancies of between 3 and 8 hours were included. The change is estimated to have reduced the recorded inflow of notified vacancies by some 4,000 to 5,000 per month since April.

There have been distortions to the Jobcentre vacancy data since May 2001. There has been a reduction in the recorded level of outflows and placings, especially for June and July and consequently an increase in the stock of unfilled vacancies. These changes mostly arise from the introduction of Employer Direct which is being gradually introduced across Grea Service Centres. So far, up to the July count, Employer Direct has begun to be introduced in all regions of Great Britain except Scotland and the North West. (In the North East a similar system has already been in place since April 1999.) There appear to have been some delays in following up vacancies with employers under the new arrangements. When the new service settles down, effects on the statistics may disappear but it is too early to assess this.

The introduction of Employer Direct may also have had some effect on the level of newly notified vacancies due to differences in vacancy reporting procedures, but probably only to a relatively minor extent. The possible effects are being investigated

Stoppages in progress: industry

a Some stoppages which affected more than one industry group have been counted under each of
the industries but only once in the total for all industries and services.
** Less than 50 workers involved.
*ess than 50 working days lost.

\section*{Stoppages in progress: cause}
\begin{tabular}{|c|c|c|c|}
\hline \multirow[t]{2}{*}{United Kingdom} & \multicolumn{3}{|l|}{12 months to June 2001} \\

\footnotetext{
a The taxes excluded are Council Tax, VAT, duties, car purchase tax and vehicle excise duty, insurance tax and airport tax.
Note: Indices are given to one decimal place to provide as much information as is available although accuracy is reduced at lower levels of aggregation.For this reason, annual percentage changes for individual sections are given rounded to the nearest whole number.

See general notes under Table H. 13 .
}

\title{
RETAIL PRICES \\ Average retail prices of selected items
}

Shown below are key items selected from the Genera Index of Retail Prices. The average prices for these goods have been derived from prices collected in more than 146 areas in the United Kingdom.

Average prices on 17 July 2001

\footnotetext{
a Or Scottish equivalent.
Average price estimates include prices of delivered milk and shop-bought milk. However, 80 per cent price range includes only shop-bought milk.
}

From February 1999, prices for these items are quoted as per kg. In order to calculate the price per lb (the previously published measure), divide the given price per kg by 2.203 . In the case of mushrooms, in order to calculate the price per 40 z (the previously published measure), divide the given price by 8.812
d From February 2000, 4-star petrol and derv were replaced with lead replacement petrol and ultra low sulphur diesel respectively.

\section*{General notes -retail prices}

The responsibility for the Retail Prices Index was transferred in July 1989 from the Employment Department to the Office for National Statistics (formerly Central Statistical Office). The RPI is now published in full in the ONS Business Monitor MM23.

\section*{Structure}

With effect from February 1987 the structure of the published components was recast. In some cases, therefore, no direct comparison of the new component with the old is possible. The relationship between the old and the new index structure is shown in Employment Gazette, p379, September 1986.

\section*{Definitions}

Seasonal food: items of food the prices of which show significant seasonal variations. These are fresh fruit and vegetables, fresh fish, eggs and home-killed lamb.

Consumer durables: Furniture, furnishings, electrical appliances and other household equipment, men's, women's and children's outerwear and footwear, audio-visual equipment, records and tapes, toys, photographic and sports goods

\footnotetext{
a For the February, March and April 1988 indices the weights used for seasonal and non-seasonal food were 24 and 139 respectively. Thereafter the weight for home-killed lamb (a seasonal item)
was increased by 1 and that for imported lamb (anon-seasonalitem) correspondingly reduced by 1 , in the light of new information about the relative shares of household expenditure
b The nationalised industries index is nolonger published from December 1989.
}
