# NATIONAL INCOME AND EXPENDITURE IN THE FIRST QUARTER OF 1989

## Gross domestic product at current and constant prices

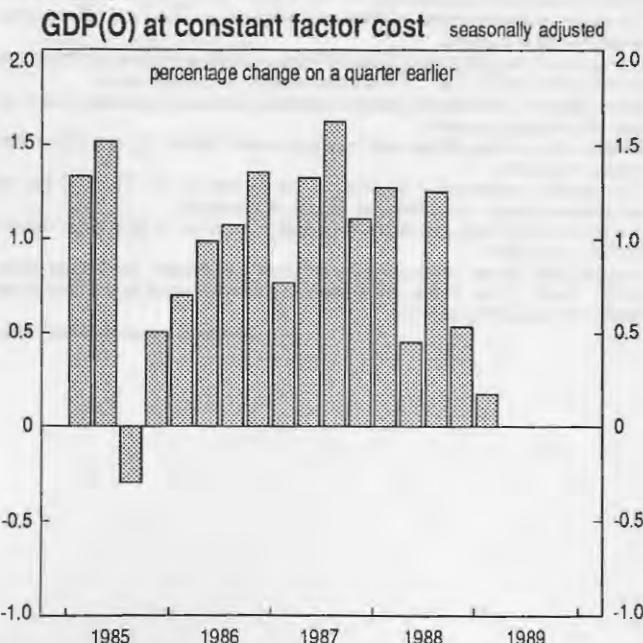

In the first quarter of 1989, the average measure of GDP at constant 1985 factor cost was 1½ per cent higher than in the first quarter of 1988. However this estimate is affected by the erratic quarterly paths of the expenditure and income measures of GDP. On this occasion a more informative comparison may be between the latest half year (the fourth quarter of 1988 and first quarter of 1989 combined) and the same period a year earlier: over this period the average measure of GDP grew by 2½ per cent. Growth rates of the average measure of GDP over recent years are shown in Chart 1.

Chart 1

Between the fourth quarter of 1988 and the first quarter of 1989 the average measure of GDP increased ½ per cent. The output based measure, GDP(O), which is usually the most reliable indicator of short term change, was broadly unchanged in the first quarter of 1989 compared with the previous quarter following an increase of ½ per cent between the third and fourth quarters of 1988. Chart 2 shows quarterly growth rates of GDP(O).

Chart 2

This article presents quarterly estimates of national income, expenditure and output to the first quarter of 1989. Estimates of the components of GDP at constant prices are given here in terms of average 1985 prices. Summary estimates of GDP were first issued on 20 June 1989. This article incorporates later data than were available at that time. A short description of the United Kingdom national accounts is given as the introduction to the 1988 Edition of 'United Kingdom National Accounts', otherwise known as 'the CSO Blue Book' whilst more detailed information is available together with details of sources, methods and definitions used, in 'United Kingdom National Accounts: Sources and Methods' (HMSO 1985). Subsequent changes to sources, methods and definitions are described in the methodological notes to the 1988 CSO Blue Book. All commentary and charts are in terms of seasonally adjusted data.

The implied factor cost GDP deflator ('index of total home costs') increased by 8½ per cent between the first quarters of 1988 and 1989 including an increase of 2 per cent between the fourth quarter of 1988 and the first quarter of this year.

The average measure of GDP at current market prices ('money GDP') was 10 per cent higher in the first quarter of 1989 than in the same period of 1988.

The real income of the United Kingdom, as shown by gross national disposable income at constant market prices, increased by 3½ per cent between the first quarters of 1988 and 1989.

Estimates of GDP at current and constant prices, of real national disposable income and of the implied GDP deflators are given in index number form in table A. This is supplemented by information about the average measure of GDP presented in Table 1 of the Appendix. This table shows average estimates of GDP on four bases (at current market prices, current factor cost, constant market prices and constant factor cost) expressed both in £ million and in index number form.

Revisions to GDP estimates and the main components, since the last set of quarterly estimates appeared in the April issue of Economic Trends, are described later in this article.

## Expenditure at current and constant 1985 prices (Table A2)

At current prices, the expenditure measure of gross domestic product at factor cost, GDP(E), rose by 2 per cent in the first quarter of 1989 to a level 9½ per cent higher than at the same time last year.

The provisional figures record GDP(E) at constant 1985 factor cost falling ½ per cent in the first quarter of 1989, following a rise of 2 per cent in the previous quarter. Between the first quarters of 1988 and 1989 the expenditure measure records an increase of 1 per cent in the level of GDP. The low levels of recorded GDP(E) in recent quarters may be indicative of some under-recording of expenditure and this should be borne in mind in the following comparisons.

At constant prices, consumers' expenditure increased ½ per cent between the fourth quarter of 1988 and the first quarter of 1989 whilst its level was 4½ per cent higher than the same period in 1988. General government final expenditure was ½ per cent higher in the first quarter of 1989 than the previous quarter and 1½ per cent higher than a year previously. Fixed investment, at constant prices, was 1 per cent higher in the first quarter of 1989 compared with the previous quarter reaching a level 9½ per cent higher than a year earlier. Stocks rose £500 million in the first quarter after a rise of £1500 million during the fourth quarter of 1988.

1 These estimates are given to one decimal place but this does not imply that they can be regarded as accurate to the last digit shown.

2 "Money GDP".

3 Also known as Real national disposable income (RNDI).

4 Income data deflated by the implied GDP deflator at factor cost, based on expenditure data.

5 The deflator implied by the expenditure-based GDP estimate at factor cost, that is the current price expenditure-based estimate of GDP at factor cost divided by the corresponding 1985 price estimate. Also known as the Index of total home costs.

At constant 1985 prices, total domestic expenditure (which is the sum of consumers' expenditure, general government final consumption, fixed investment and stockbuilding) fell ½ per cent between the fourth quarter of 1988 and the first quarter of 1989 to a level 5 per cent higher than the first quarter of 1988. The expenditure measure of GDP was reduced by a deterioration in the balance of overseas trade in goods and services, expressed at constant 1985 prices, from a deficit of £2,400 million in the first quarter of 1988 to a deficit of £6000 million in the fourth quarter of 1988 and £6,100 million in the first quarter of 1989.

#### Income at current prices (Table A3)

At current prices, the income measure of gross domestic product at factor cost, GDP(I), increased 3½ per cent between the fourth quarter of 1988 and the first quarter of 1989 to a level 9½ per cent higher than a year earlier.

Income from employment in the first quarter of 1989 increased by 2 per cent compared with the fourth quarter of 1988 and was 10 per cent up compared with the first quarter of 1988.

The gross trading profits of the corporate sector rose 9 per cent between the fourth quarter of 1988 and the first quarter of 1989 reaching a level 9½ per cent higher than a year earlier. Within this total the gross trading profits of companies were 10 per cent higher in the first quarter of 1989 than a year earlier whilst the gross trading surplus of public corporations increased 6 per cent

over the same period. These latter comparisons are distorted by the transfer of British Steel PLC to the private sector in December 1988.

When deflated by the implied index of total home costs, GDP(I) was 1½ per cent higher in the first quarter of 1989 than the previous quarter and 1 per cent higher than the same quarter last year. In the latest half year it was 2 per cent higher than during the same period a year earlier.

#### Output at constant 1985 prices (Table A4)

There was no significant change in the output measure of gross domestic product, GDP(O), between the fourth quarter of 1988 and the first quarter of 1989 and the level in the first quarter was 2½ per cent higher than a year previously.

The output of the production industries declined 1 per cent between the fourth quarter of 1988 and the first quarter of 1989. Manufacturing output increased by 1 per cent in this period whilst energy output dropped 7 per cent.

Construction output rose 3½ per cent between the fourth quarter of 1988 and the first quarter of 1989. Over the same period the output of the service industries increased ½ per cent, including a 1 per cent increase in distribution, catering and related activities and a 1 per cent reduction in the transport and communications industries. The output of other service industries increased ½ per cent.

### Personal income and saving (Table A7)

Real personal disposable income (RPDI) increased by  $\frac{1}{2}$  per cent between the fourth quarter of 1988 and the first quarter of 1989 to reach a level which was  $4\frac{1}{2}$  per cent higher than the first quarter of 1988. (Percentage changes in the components of personal income are shown in Table B.)

TABLE B

	CHANGES IN PERSONAL INCOME	
	Seasonally adjusted	
	Percentage change	
	Latest quarter over same quarter in previous year	Latest four quarters on previous four quarters
	1989 Q1	1988 Q2 to 1989 Q1
Total personal income	10%	10%
of which: Wages, salaries and forces' pay	10%	11
Employers' contributions	8	7
Current grants from general government	$\frac{1}{2}$	$2\frac{1}{2}$
Other income	$18\frac{1}{2}$	$15\frac{1}{2}$
UK taxes on income	$9\frac{1}{2}$	11
Social security contributions	$12\frac{1}{2}$	12
Total personal disposable income	10%	10
Consumers' expenditure implied deflator	5%	5%
Real personal disposable income	4 $\frac{1}{2}$	4 $\frac{1}{2}$

Total personal income, before deductions, rose 2 per cent between the fourth quarter of 1988 and the first quarter of 1989. Within the total, wages and salaries rose by 2 per cent, employers' contributions grew by  $2\frac{1}{2}$  per cent, current grants from general government fell by 1 per cent while other personal income, which includes dividends, rose  $3\frac{1}{2}$  per cent.

Personal disposable income increased by 2 per cent between the fourth quarter of 1988 and the first quarter of 1989. Prices, as measured by the consumers' expenditure deflator, rose by  $1\frac{1}{2}$  per cent in the same period and, as a result, RPDI increased by  $\frac{1}{2}$  per cent.

Between the fourth quarter of 1988 and the first quarter of 1989 consumers' expenditure, like personal disposable income rose by 2 per cent and the saving ratio remained unchanged at 5 per cent. The saving ratio over recent years is shown in Chart 3.

Chart 3

### Consumers' expenditure (Table A8)

At current prices, consumers' expenditure grew 2 per cent between the fourth quarter of 1988 and the first quarter of 1989 to reach a level 10 per cent higher than in the first quarter of 1988.

At constant prices, consumers' expenditure increased  $\frac{1}{2}$  per cent in the first quarter of 1989, compared with the previous quarter, and was  $4\frac{1}{2}$  per cent higher than a year earlier. In the latest quarter, expenditure on durable goods increased  $1\frac{1}{2}$  per cent whilst spending on other goods and services was  $\frac{1}{2}$  per cent higher than the previous quarter. Chart 4 shows the growth of consumers' expenditure on durable goods and other goods and services.

Comparing expenditures in the first quarters of 1988 and 1989 at constant prices there was a  $5\frac{1}{2}$  per cent growth in spending on durable goods, including an 11 per cent rise on vehicles and 3 per cent on furniture and floor coverings whilst spending on other durables fell by  $1\frac{1}{2}$  per cent. Among non durable items spending on food fell  $1\frac{1}{2}$  per cent between the first quarters of 1988 and 1989, expenditure on alcoholic drink rose 1 per cent and on tobacco fell  $\frac{1}{2}$  per cent. Over the same period spending on clothing and footwear rose by 2 per cent and on energy products fell by 2 per cent whilst expenditure on services rose 7 per cent.

Chart 4

### Consumers' expenditure

1985 prices, seasonally adjusted

### Industrial and commercial companies (Table A10)

Provisional estimates suggest that, after deducting stock appreciation, UK profits of industrial and commercial companies rose by 9 per cent between the fourth quarter of 1988 and the first quarter of 1989.

Between the latest two quarters, gross trading profits (net of stock appreciation) of North Sea oil companies fell by 11 per cent. In the latest quarter these profits were 38 per cent lower than a year earlier.

The gross trading profits (net of stock appreciation) of non-North Sea industrial and commercial companies are estimated to have been 11 per cent higher in the first quarter of 1989 than the previous quarter, following a fall of 3 per cent between the third and fourth quarters of 1988. In the first quarter of 1989 these profits were 12 per cent higher than a year earlier.

Payments of dividends on ordinary shares (net of payments by UK subsidiaries to their overseas parent companies and net of payments to other UK industrial and commercial companies) are estimated to have risen by 12 per cent between the fourth quarter of last year and the first quarter of this year. This rise reflects increases in the number of ordinary shares in issue as well as higher payments on existing shares.

In the first quarter of 1989 payments of UK taxes on income were 3 per cent lower than in the fourth quarter of 1988 and 2 per cent lower than a year earlier.

These preliminary estimates suggest that the broad measure of UK industrial and commercial companies' undistributed income (that is, before deducting stock appreciation or net unremitted profits from and due to related overseas concerns) was £10,100 million in the first quarter of 1989, compared with £9,200 million in the previous quarter.

#### Public corporations (Table A12)

Provisional estimates suggest the gross trading surplus of public corporations (after deducting stock appreciation) was 19 per cent higher in the first quarter of 1989 than a year earlier. This comparison is distorted by the privatisation of British Steel PLC in December 1988.

#### Central government (Table A13)

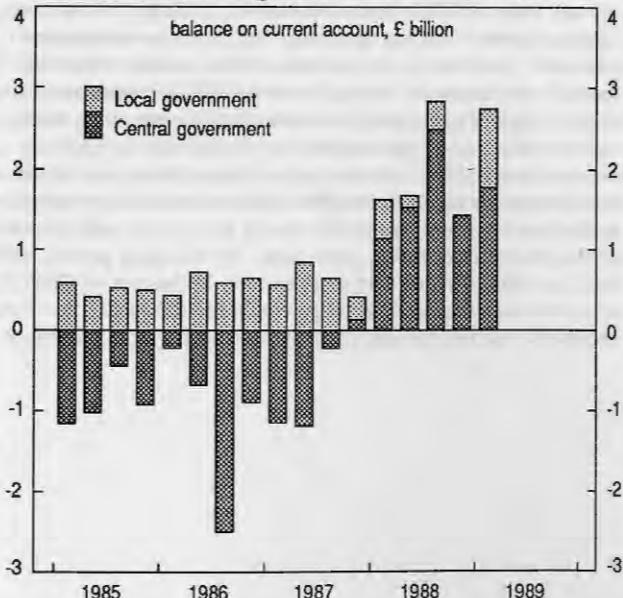

Total central government receipts rose by 5 per cent between the first quarters of 1988 and 1989. This included rises of 7 per cent in taxes on expenditure and a 12 per cent rise in national insurance contributions.

Total current expenditure of central government rose 4 per cent between the first quarters of 1988 and 1989. Within this total, expenditure on final consumption (military defence, health services etc) rose 11 per cent whilst expenditure on subsidies, grants and debt interest combined was unchanged.

The faster rise in income than expenditure between the first quarters of 1988 and 1989 led to a rise in the surplus of income over expenditure on the current account of central government from £1,100 million in the first quarter of 1988 to £1,800 million in the first quarter of this year.

The quarterly balances on the current accounts of central government and local authorities over recent years are shown in Chart 5.

**Chart 5**  
**Central and local government** seasonally adjusted

#### Local authorities (Table A14)

Total current receipts of local authorities were 9 per cent higher in the first quarter of this year than a year earlier. Current grants from central government increased 5 per cent over this period whilst rate receipts rose 11 per cent.

Total current expenditure rose 5 per cent between the first quarters of 1988 and 1989 with expenditure on final consumption up 6 per cent over this period and expenditure on subsidies, grants and debt interest combined up 1 per cent.

#### International transactions (Table A15)

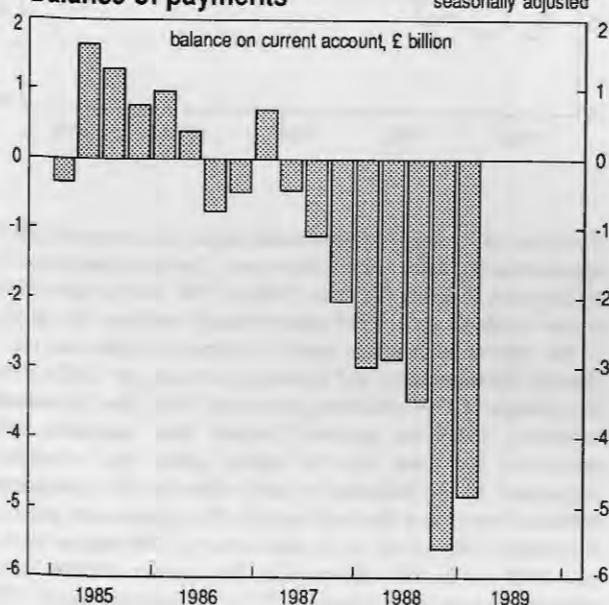

At current prices, exports of goods increased 14 per cent between the first quarters of 1988 and 1989 whilst exports of services increased 8 per cent over the same period. Property income from abroad rose 29 per cent. Over the same period total UK current account credits, including transfers, increased 18 per cent.

At current prices, imports of goods were 19 per cent higher in the first quarter of 1989 than a year earlier and imports of services 13 per cent higher. Over the same period property income paid abroad increased 33 per cent. Overall UK current account debits, including transfers, increased 21 per cent between the first quarters of 1988 and 1989.

With imports of goods and services rising faster than exports over this period the deficit on the current account of the balance of payments increased from £3,000 million in the first quarter of 1988 to £5,600 million in the fourth quarter of last year before recovering somewhat to £4,800 million in the first quarter of this year. Trends in the current account balance over recent years are shown in Chart 6.

**Chart 6**

#### Balance of payments

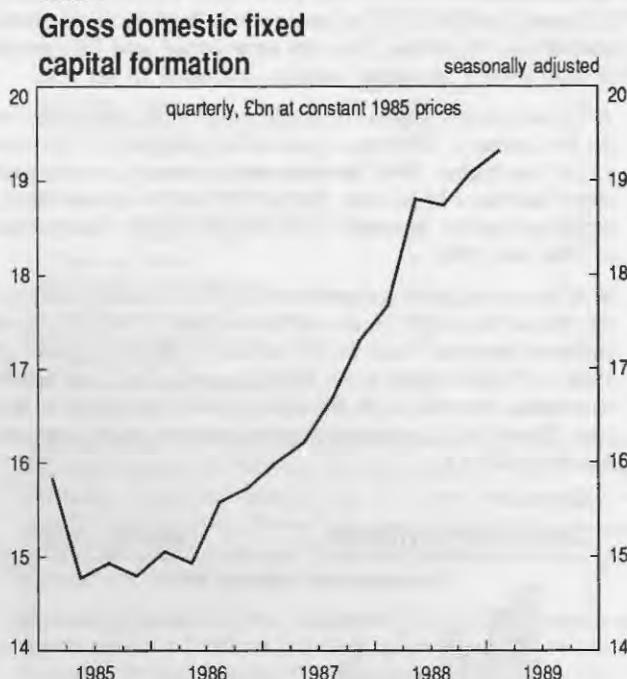

At constant 1985 prices, exports of goods were 4 per cent higher in the first quarter of this year than a year earlier whilst exports of services were unchanged. Imports of goods were 17 per cent up and imports of services 7 per cent higher over the same period.

### Gross domestic fixed capital formation at 1985 prices (Tables A17 and A18)

Total fixed investment is estimated to have been 9 per cent higher in the first quarter of 1989 than a year earlier. Fixed investment by the private sector rose 11 per cent whilst general government expenditure on fixed assets was unchanged. Over the same period fixed investment by public corporations fell 4 per cent though this comparison is distorted by the privatisation of British Steel PLC in December 1988. These estimates include special adjustments aimed at bringing them closer to the final figures produced when full information is available. The quarterly profile of fixed investment over recent years is shown in Chart 7.

Chart 7

Estimates of fixed investment made earlier this year and which appeared in the April issue of Economic Trends included special adjustments covering the years 1986 to 1988. Fuller information is now available up to 1987 which broadly confirms the validity of the special adjustments made in respect of 1986 and 1987. Special adjustments are still necessary however for 1988 and the first quarter of 1989 reflecting a shortfall in the fixed investment estimates, based on quarterly inquiry data, compared with production and trade data for capital goods, and a modified adjustment in the deflation process allowing for divergences between import and domestic prices. The adjustments amount, at constant 1985 prices, to an addition of £3,200 million for the year 1988 and £1,500 million in the first quarter of 1989. These adjustments have been allocated 10% to the personal sector, 70% to industrial and commercial companies and 20% to financial companies. These adjustments have not been allocated by asset and industry, however, because information is not available to do this.

### Value of physical increase in stocks and work in progress at 1985 prices (Table A19)

Stocks rose £500 million in the first quarter of 1989 compared with £1,500 million the previous quarter and £100 million in the first quarter of last year. In the first quarter of this year stocks of the energy and water supply industries rose £300 million and manufacturers stocks increased £200 million. On the other hand stocks of the distributive trades fell.

### Rewards (Table A20)

Estimates of GDP are subject to revision as more information becomes available. Since the article in the April issue of Economic Trends presenting national accounts estimates for the fourth quarter and year 1988, GDP(E) has been revised downwards in 1987 and 1988 both at current and constant prices. On the other hand estimates of GDP(I) at current factor cost, for the same periods, are almost unchanged. The size of the residual error between the income and expenditure measures has reduced in 1986 and 1987 and increased by about £200 million to £6,400 million in 1988. The residual errors for 1986 and 1987 are now insignificant. The GDP(O) index has been revised upwards in 1988 by 0.2 whilst figures for earlier years remain unchanged.

Rewards to the average measure, GDP(A), have been very small with an increase of £240 million at current prices and a reduction of £130 million at constant prices occurring in 1988.

The biggest revisions to GDP(E) are downward revisions to consumers' expenditure mainly reflecting a reallocation of expenditure on vehicles between consumers' expenditure and fixed investment.

As last time, fixed investment estimates incorporate special adjustments to bring them closer to the final figures produced when full information is available. The adjustments are described in the text on gross domestic fixed capital formation above.

Amongst GDP(I) components, small revisions have been made to estimates of income from employment, gross trading profits, 'other' income and stock appreciation reflecting fuller information from various sources.

The biggest contribution to the upwards revision of the GDP(O) index by 0.2 is revised estimates of the index for transport and communication reflecting revised Department of Transport data on UK freight activity.

### Rewards in the longer term

A longer term analysis of rewards experience, published in the August 1987 issue of Economic Trends shows that revisions to growth rates of GDP data published for 1971 to 1981 were on balance upwards but not uniformly so. If past revisions were to continue - and this is by no means certain since compilation methods are regularly revised and modified as necessary - the analysis suggest a likely range within which the eventually revised value of the rate of growth will lie. In this article GDP(A) at constant factor cost is estimated to have risen 1½ per cent between the first quarter of 1988 and 1989. If future revisions are similar to the past there is a two-thirds chance that the revised estimate of the growth rate in five years time, for the same period, will be in the range 1¼ per cent to 3 per cent. In the case of GDP(A) at current market prices the range would be 10½ to 12½ per cent compared with the estimate of 10 per cent appearing in this article.

## NOTES

### GDP estimates

1. Although estimates of gross domestic product (GDP) based on expenditure, income and output should in principle give the same result, in practice there are often variations between them. The average measure of gross domestic product, GDP(A), is the definitive estimate of levels of GDP, as well as of medium and long term changes. For comparisons of periods of less than a year the output measure, GDP(O), is usually the best indicator.

GDP(A) is calculated, for recent years, as the unweighted arithmetic average of the three estimates based on expenditure, income and output data, with the level of output measure in the base year determined by the average of the income and expenditure measures. (For years prior to 1985 a slight variation of this method is necessary as described in the October 1988 issue of Economic Trends).

### Caution in interpretation

2. The problems of consistency, particularly in terms of timing, between the different types of administrative and statistical records used in compilation of GDP have an important bearing on reconciliation of the three independent GDP estimates. In the interpretation of quarterly and annual national accounts estimates, special attention also needs to be paid to the higher margins of error attaching to series estimated at constant prices when the rate of inflation is changing significantly. Movements in exchange rates may also affect the valuation of international transactions and the measurement of profits derived from them.

In the light of inconsistencies in the national accounts the Government set up a review of economic statistics charged with making recommendations for achieving cost effective improvements where necessary. Its report recommended a large number of specific ways of improving the quality of government economic statistics, the great bulk of which will be implemented over the next year.

National accounts estimates at constant prices have, since the five yearly rebasing last September, been made at 1985 prices and indices calculated in terms of  $1985 = 100$ . Interpretation of estimates at constant prices should bear in mind that the choice of base year can affect significantly assessment of GDP growth rates where sharp changes in relative prices occur. In this connection it may be noted that the relative price of oil products was much higher in 1985 than today, with the result that GDP estimates at constant 1985 prices give a much larger weight to the recent decline in UK oil production than would be the case if estimates of GDP at constant prices were made in terms of a more up to date price structure. Estimated GDP growth rates calculated at 1985 prices are therefore likely to be somewhat lower for recent quarters (and increases in the GDP deflator somewhat higher) than if they had been estimated using a more recent price structure.

### Balanced Accounts

3. As a contribution to debate on inconsistencies in the national accounts, including the large sectoral balancing items, the CSO has produced balanced sets of national and sector accounts for each of the years 1985 to 1987. These appeared in the February issue of Economic Trends published on 10 March 1989.

### Appendix Tables

4. The tables in the Appendix give series of quarterly figures back to 1985. Where an obelus appears this indicates that the data are new or have been revised, with the period so marked the earliest to have been revised. If the obelus appears against the first figure in a column, this implies that earlier data may also have been revised. Such earlier data can be obtained from the CSO Databank, which contains all of the series given in the Appendix tables.

### The CSO Databank

5. The data in these tables can be obtained in computer readable form via the CSO Databank service which provides macroeconomic time series data on magnetic tape. Each series on the Databank is allocated a four letter identifier which appears in the Appendix tables at the head of each column of data. The Databank enables users, host bureaux and end users to have a longer run of the data than can be included in the tables.

Details of the service offered and the Schedule of charges may be obtained from the Databank Manager, CSO Branch 9, Room 52A/4, Government Offices, Great George Street, London SW1P 3AQ (Telephone: 01-270 6386 or 6387). CSO does not offer direct on-line access for these data, but a list of host bureaux offering such a facility is available on request from CSO.

1 Equals taxes on expenditure less subsidies.

2 The factor cost estimate of GDP is obtained from the market price estimate by subtracting the factor cost adjustment.

3 Gross national product equals Gross domestic product plus Net property income from abroad.

4 Represents Taxes on expenditure less Subsidies both valued at 1985 prices.

5 The deflator implied by the expenditure-based GDP estimate at factor cost is the current price expenditure-based estimate of GDP at factor cost divided by the corresponding 1985 price estimate. Also known as the Index of total home costs.

1 For years up to and including 1982, totals differ from the sum of the components because of the method used to rebase on 1985 prices.

2 Represents Taxes on expenditure less Subsidies, both valued at 1985 prices.

3 The average estimate of Gross domestic product is estimated in seasonally adjusted form only. Therefore whilst both a seasonally and an unadjusted version exist of the Residual error, the attribution of statistical discrepancies to the expenditure-based and income-based measures can be made only in seasonally adjusted form.

# A3 Gross domestic product at factor cost: by category of Income

£ million

	Factor incomes							Gross domestic product (income-based)	Statistical discrepancy (income adjustment) <sup>7</sup>	Gross domestic product (average estimate) at factor cost <sup>7</sup>

1 Wages and salaries, forces' pay and employers' contributions.

2 Before providing for depreciation and stock appreciation.

3 Including financial institutions.

4 Figures reflect privatisations.

5 Income from rent and from self-employment, and the imputed charge for the consumption of non-trading capital.

6 The sum of the factor incomes before deducting stock appreciation.

7 The average estimate of Gross domestic product is estimated in seasonally adjusted form only. Therefore whilst both a seasonally adjusted and an unadjusted version exist of the Residual error, the attribution of statistical discrepancies to the expenditure-based and income-based measures can be made only in seasonally adjusted form.

# A4 Index numbers of output at constant factor cost

1 The average estimate of Gross domestic product is estimated in seasonally adjusted form only. Therefore, whilst both a seasonally adjusted and an unadjusted version exist of the Residual error, its apportionment to the expenditure-based and income-based measures can be made only in seasonally adjusted form.

2 The Residual error is, by convention, expressed as the amount by which

the expenditure-based estimate of gross domestic product exceeds the income-based estimate. Following this sign convention, the attribution shows the amounts by which GDP(E) exceeds GDP(A) and by which GDP(A) exceeds GDP(I).

3 Equals the Statistical discrepancy (expenditure adjustment) with sign reversed.

4 Equals the Statistical discrepancy (income adjustment) with the same sign.

1 Before providing for depreciation and stock appreciation.

2 Equals total personal income before tax less payments of taxes on income, social security contributions and other current transfers.

3 Before providing for depreciation, stock appreciation and additions to tax reserves.

4 Personal saving as a percentage of total personal disposable income.

5 Personal disposable income revalued by the implied consumers' expenditure deflator (1985 = 100).

<sup>1</sup> Including the adjustments for international travel, etc. and final expenditure by private non-profit-making bodies.

<sup>2</sup> For the years prior to 1983, the totals differ from the sum of their components due to the method of rebasing to 1985 prices.

# A9 Appropriation account of companies and financial institutions<sup>1</sup>

£ million

1 Figures reflect privatisation of British Telecom with effect from 28 November 1984, British Gas from 3 December 1986, British Airways from 6 February 1987, Royal Ordnance from 22 April 1987, BAA from 16 July 1987 and British Steel from 2 December 1988.

2 Before providing for depreciation.

3 Dividend payments on ordinary and preference shares are net of tax; the advance corporation tax in respect of such payments is included in 'UK taxes on income'. Excludes dividends and debenture interest paid by UK subsidiaries to their overseas parents.

4 Including royalties and licence fees on oil and gas production.

5 The difference between all companies' payments and financial companies and institutions' payments of taxes on income. The former include payments of corporation tax (including advance corporation tax), petroleum revenue tax, and supplementary petroleum tax.

6 Before providing for depreciation, stock appreciation and additions to reserves.

1 Before providing for depreciation and stock appreciation.

2 This represents the contribution of financial companies and institutions to the gross domestic product. It is the difference between bank charges, commissions, etc., on the one hand and management expenses (wages and salaries and payments for current expenses) on the other.

3 Dividend payments on ordinary and preference shares are net of tax; the advance corporation tax in respect of such payments is included in 'UK taxes on income'. Excludes dividends and debenture interest paid by UK subsidiaries to their overseas parents.

4 Before providing for depreciation, stock appreciation and additions to reserves.

1 Owing to the Civil Service dispute, the figures for 1981 are less reliable than usual.

2 Tax receipts less tax credits.

3 These include contributions to the Maternity Pay Fund, and from Q2 1982, contributions from employees.

4 Before providing for depreciation and stock appreciation.

5 Including royalties and licence fees on oil and gas production.

6 The coverage of the figures from 1983 onwards differs from that for earlier periods because of the effects of the introduction of the new housing benefit scheme at the end of 1982.

1 The coverage of the figures from 1983 onwards differs from that for earlier periods because of the effects of the introduction of the new housing benefit scheme at the end of 1982.

2 Adjustments to accruals of rates for the quarter, as included in taxes on expenditure and in the adjustment to factor cost in Table 2.

3 Before providing for depreciation and stock appreciation.

1 Sector estimates and totals include special adjustments outlined in the text.  
As explained in the text these adjustments are not however allocated by asset or industry.

2 Including purchases less sales of land and existing buildings.

3 Including transfer costs of land and buildings.

4 For the years before 1983, the totals differ from the sum of their components due to the method of rebasing to 1985 prices.

# A18 Gross domestic fixed capital formation by industry group<sup>1</sup>

# Regional accounts 1987

## Part 2: Household income by county

In recent years there has been an increasing desire to measure the economic well-being of the regions of the European Community. This has arisen from the desire to target grants from the three structural funds<sup>(1)</sup> on the most needy areas. Increasing dissatisfaction with existing statistics as measures of economic well-being has led the Statistical Office of the European Communities to recommend the development of statistics of household income as a supplementary indicator. The Central Statistical Office is at the forefront of this work and has developed a new set of estimates of household income and household disposable income by county<sup>(2)</sup>. The first results are presented here and it is hoped that these estimates for 1984 and provisional estimates for 1987 can be developed into an annual series published in March or April each year.

This article also presents provisional estimates of consumers' expenditure by standard region for 1987 together with revised estimates for 1984 to 1986. Also included in the article are revised estimates of gross domestic product (GDP) by county<sup>(2)</sup> for 1984, which are compared with the estimates of household income. Part 1 of the regional accounts 1987 was published in *Economic Trends*, November 1988. It included estimates of GDP, gross domestic fixed capital formation and personal incomes for the eleven regions of the United Kingdom.

### Household income

Household income is the total income of individuals living in private households and institutions. It includes income from employment, from self-employment, from rent, dividends and interest, from pensions, from social security and from other sources. These estimates of household income have a narrower coverage than the estimates of personal income published annually by the CSO since 1976 (see technical note 3).

(1) The European Regional Development Fund (ERDF), the European Social Fund (ESF) and the guidance section of the European Agricultural Fund (EAGGF).

Household income and disposable income have been estimated for 1984 and 1987. The sources and methods used are discussed briefly in the technical notes, but there are three significant points affecting the quality of the estimates. Firstly the results may tend to underestimate income in fast-growing counties and vice-versa (see technical note 4). Secondly the results for small counties will be less reliable than those for larger counties as sampling error is greater. As with estimates for GDP it has been felt necessary to combine the results for the smallest counties with those for neighbouring counties. Thirdly 1987 estimates are to a large extent projections and firmer figures will be published in *Economic Trends* in March or April 1990.

### Sources of household income

The main source of household income in all regions is income from employment. However, the relative importance of this and other sources varies from region to region as shown in Table A. These variations arise for both demographic and economic reasons. For example self-employment income is relatively more important in East Anglia (11 per cent of household income in 1987) reflecting partly the importance of agriculture to the region's economy. Self-employment income is least important in the North and North West (7 per cent). Investment income varies widely in importance from 4 per cent in Northern Ireland to 11 per cent in the South West. The high proportion of income derived from pensions in the South West is a reflection of the high proportion of retired people in the region (as shown in Appendix Table 4). Social security benefits were most important in Northern Ireland (11 per cent) reflecting the high proportions of children and unemployed people and least important in the South East and East Anglia (5 per cent). These variations will be greater at county level, but the analysis is subject to a greater degree of sampling error and has not been presented here. Estimates of household income by source are given fully in Appendix Table 1.

(2) The counties of England and Wales, the local authority regions of Scotland and Northern Ireland as a whole.

1. Provisional

## Recent trends in household income

Total household income varied from £46 billion in Greater London to under £1 billion for the smallest counties in 1987 (see Appendix Table 2). Such large differences arise because of differences in the size of the population and comparisons between regions and counties tend therefore to be made in terms of household income per head. Household income per head is estimated to have been highest in Surrey (£8,059 in 1987) and lowest in Mid Glamorgan (£4,282). These comparisons make no allowances for the different cost of living in different parts of the UK and therefore cannot be interpreted as precise measures of comparative living standards.

The level of household income per head will be affected both by the earnings of the working population and by the proportion of dependents. Northern Ireland households for example have a high proportion of children whose income and expenditure are both low; 25 per cent of the population was aged 14 or under in 1987 compared with 17 to 20 per cent in most counties. This will tend to depress income per head and should be taken into consideration when assessing living standards or economic well-being. Mid Glamorgan also has a slightly younger population than average with 20 per cent aged 14 or under in 1987.

It is clear from Appendix Table 2 that all the counties in the South East and South West have relatively high average household income. All counties in these regions except Cornwall and Somerset had above average household income per head in 1987, whereas only six areas outside these regions were above average: Grampian, Lothian and Borders combined, North Yorkshire, Cheshire, Cumbria and Cambridgeshire. At the other extreme average income per head is lowest in the Welsh counties (except South Glamorgan), Northern Ireland, Durham, Greater Manchester, the West Midlands county, Tyne and Wear and the Highlands and Islands.

Trends in total household income per head cannot be analysed easily without deflating the data. However, there are no regional or county price indices, which could be used to remove the effect of inflation from the income figures. It is usual therefore to look at changes in income per head, even though this obscures the effect of demographic changes on the total income of the county. In counties where the population is increasing, the total income of the county would be expected to grow relatively fast and vice versa. Buckinghamshire and Dorset are two counties which have experienced relatively high rates of population growth and total household income is certainly growing faster than the UK average; the same is not necessarily true of income per head.

Changes between 1984 and 1987 should be interpreted with caution because of the provisional nature of the 1987 figures. In addition there were two special factors affecting income in some counties in 1984. The first factor was the miners' strike which

depressed household income particularly in Durham, Northumberland, South Yorkshire, Gwent, Mid Glamorgan and Fife. The second factor was the excellent grain harvest in 1984, which increased income in arable areas such as East Anglia, Lincolnshire, North Yorkshire, Oxfordshire, Shropshire and Humberside.

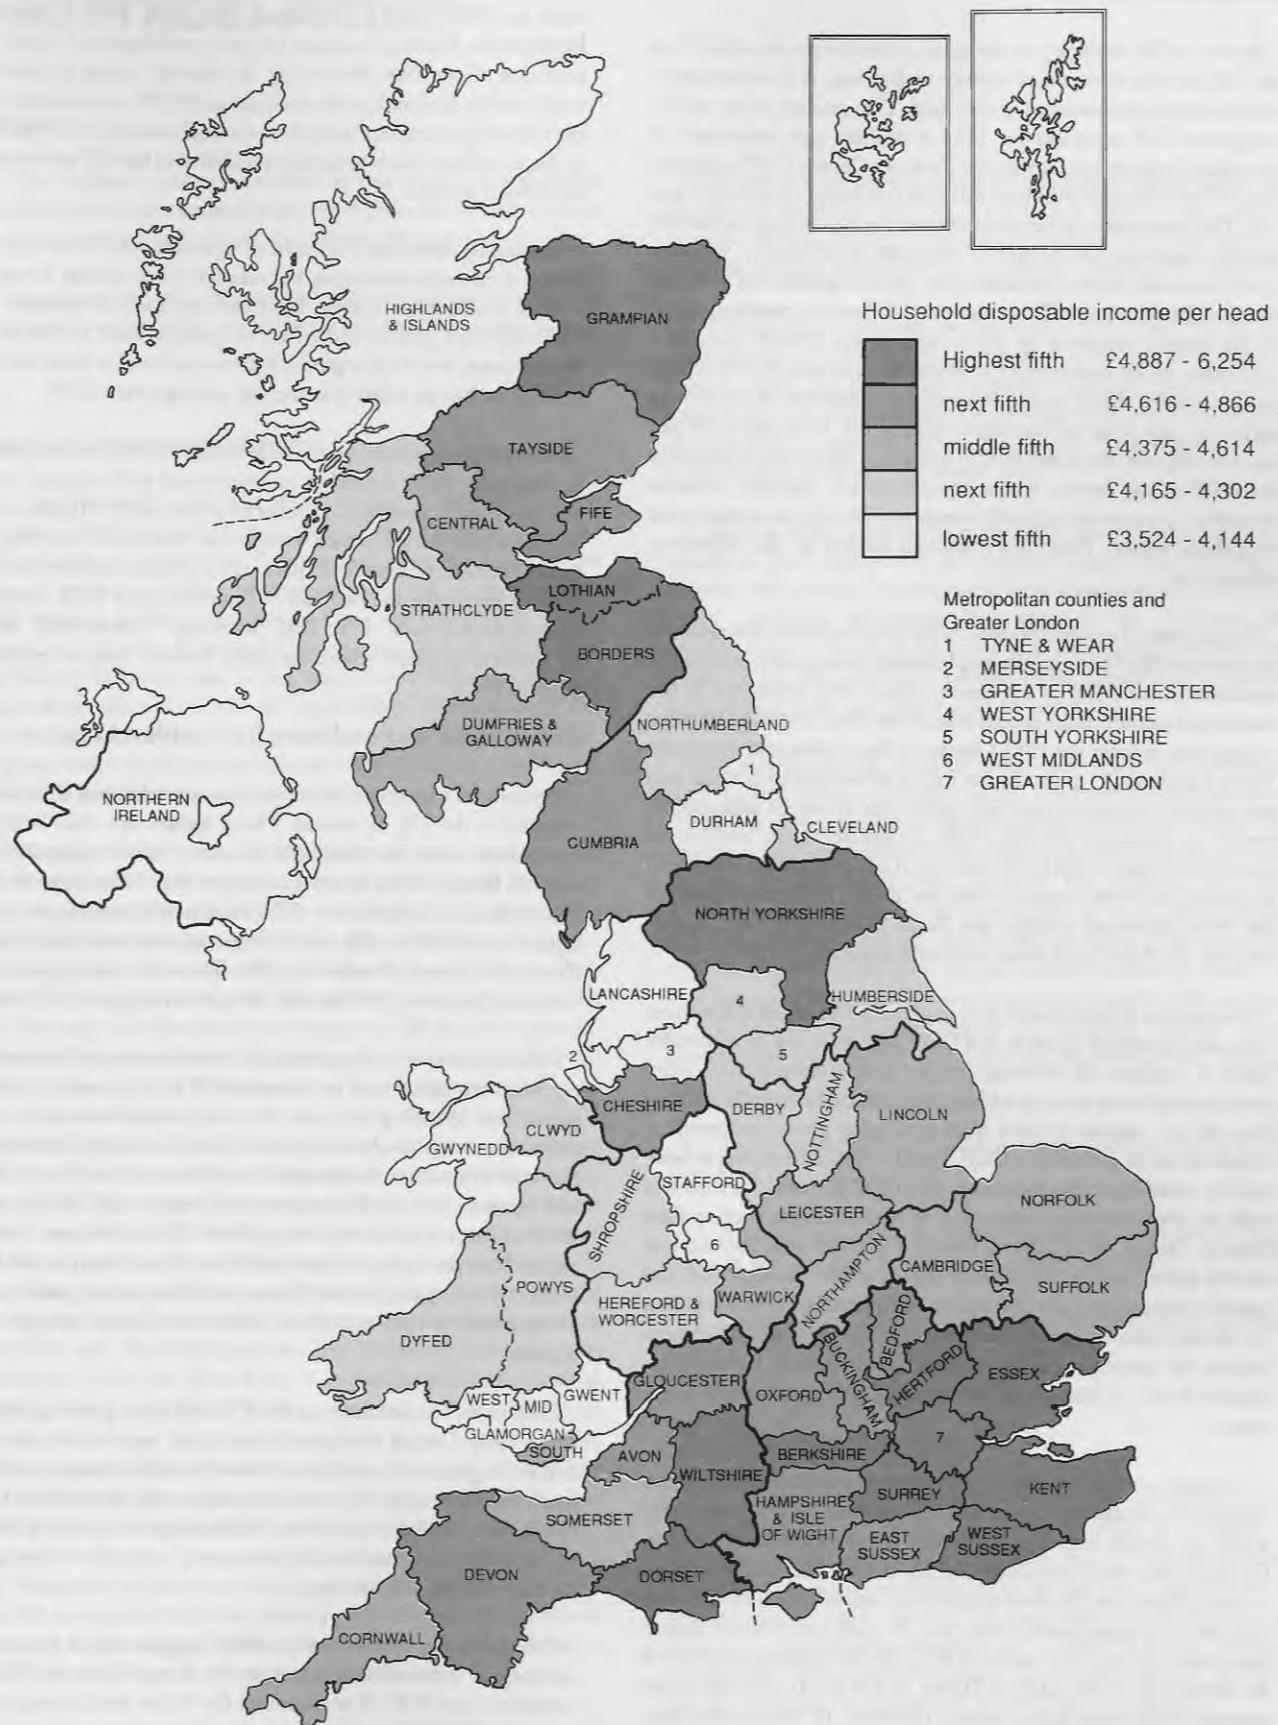

Changes in household income per head relative to the UK average between 1984 and 1987 which are not affected by the special factors outlined above, are for the most part small and may well be within the margin of error of the statistics. One or two more significant changes occurred in Grampian, South Glamorgan, Cornwall and Surrey. In Grampian average income slipped from 114 per cent of the UK average in 1984 to 107 per cent in 1987 on the provisional estimate. The decline in oil-related activity and a reduction in farming income from the high level of 1984 both contributed to this fall. These figures also suggest that average household income fell relative to the UK average in South Glamorgan, however the size of the fall is surprising and should be interpreted with caution given the provisional nature of the estimates. In Surrey average household income increased relatively fast rising from 135 per cent to 140 per cent of the UK average between 1984 and 1987. These estimates also suggest that average income rose sharply in Cornwall.

## Disposable income by county

Disposable household income, which is equal to gross income less payment of tax, National Insurance and contributions to life assurance and pension schemes, is shown in Appendix Table 3. In 1987 household disposable income ranged from £6,254 per head in Surrey to £3,524 in Mid Glamorgan. As might be expected there is less variation in disposable income than in total household income, however the effect is slight. Household disposable income per head ranged from 77 per cent of the UK average for the lowest county to 137 per cent for the highest in 1987 compared with 75 per cent to 140 per cent for total household income per head. The five quintile groups in the distribution of disposable income relative to the UK are shown in the map opposite.

The proportion of tax, National Insurance and other contributions paid in 1987 varied from 16 and 17 per cent of total income in counties with low average household income to 23 per cent in Buckinghamshire, Greater London, Hertfordshire and Berkshire. Broadly speaking the proportion increases with income, but there are some exceptions. In particular counties with high numbers of pensioners tend to pay less tax, National Insurance and other contributions than other counties with similar income levels. The household disposable income for these counties tends to be higher relative to the UK average than household income. Dorset for example had the sixth highest household income per head, but the fourth highest household disposable income per head.

2. Provisional

## Comparisons with GDP

In view of the tendency to use gross domestic product (GDP) as an all purpose measure of county well-being, it is important to understand its deficiencies in this field. This section of the article compares GDP estimates for 1984 with these new estimates of household income (see Appendix Table 4). County GDP estimates for 1987 will be published later this year (see technical notes 17 and 18). The conceptual difference between the two is that household income measures the income of residents of a county, whereas gross domestic product measures the value of goods and services produced in the county. This conceptual difference manifests itself in the county estimates in three main ways. Firstly there is a difference in the treatment of commuters' income, which affects some counties significantly. Secondly the number of pensioners influences the level of household income per head and GDP per head in different ways and thirdly company profits are included in the GDP of the county where companies are located, whereas household income includes dividends and interest received by the household sector. These are discussed further in the following paragraphs.

The number of commuters affects the relative levels of household income and GDP because the employment income of commuters is included in the GDP of the county where they work, but in the household income of the county where they live. The latest data for commuting is from the 1981 Census of Population and Appendix Table 4 (column 5) gives the net inflow of employed persons as a percentage of resident numbers employed. It can be seen that as would be expected counties with a significant net outflow of commuters tend to have lower relative GDP per head than household income. Conversely counties with a net inflow like Greater London the West Midlands county and South Glamorgan have higher relative GDP per head than household income.

The number of pensioners also explains some of the differences between household income and GDP and is shown in Appendix Table 4 (column 6). Although retired people have income from pensions and other sources which is included in household income, they do not receive income from producing goods and services which would be included in GDP. Thus household income per head will be relatively high compared with GDP per head for counties with an above average proportion of retired people such as East Sussex, Dorset, West Sussex, Devon, Cornwall and Gwynedd. A similar point can be made with regard to the unemployed and unemployment rates are also shown in Appendix Table 4 (column 7). The high percentage of unemployed in Merseyside and Northern Ireland for example partly explains the difference between the relative level of household income and GDP per head in these areas.

Company profits and trading surpluses of public enterprises can contribute a substantial proportion of a counties' GDP, particularly where one or two large establishments are sited in a small county. Profits do not benefit residents directly and are thus excluded from household income. The level of profits of individual establishments can also vary significantly from year to year and this can lead to significant year to year variation in GDP. One well known case is the sensitivity of the GDP of Dyfed to the level of profits at the several oil refineries in the county. However, in 1984 profits from oil refining were relatively low, so that differences between household income per head and GDP per head in Dyfed and other counties with refineries are not particularly apparent in 1984.

(1) Estimates of GDP by region and county are at factor cost. They measure the income of the factors of production and exclude the value of taxes on expenditure such as VAT but include subsidies.

Counties where the contribution of profits to GDP was relatively high in 1984 were Cleveland, Cheshire, Mid Glamorgan, Humberside, Nottinghamshire, Durham and Northumberland. The inclusion of counties affected by the miners' strike in this list is explained by the fact that the estimates of GDP include inter alia<sup>(1)</sup> the value of government subsidy to the coal industry. GDP per head in these counties tends to be higher relative to the UK average than household income.

Conversely there are a number of counties with relatively high levels of investment income, but relatively low profits. Examples of such counties are Surrey, Kent and some of the counties with relatively high proportions of retired people such as Dorset and West Sussex, but not Gwynedd. Income per head in these counties tends to be higher relative to the UK average than GDP.

Other differences between the GDP and household income statistics in Appendix Table 4 need to be interpreted with caution for two reasons. Firstly, there are a number of areas notably Highlands and Islands where the difference between the two sets of employment income statistics cannot be explained by commuting (see technical note 4). Secondly, the two sets of figures are not fully consistent (see technical note 17). This difficulty particularly affects agricultural counties where the grain harvest was exceptionally good in 1984.

## Consumers' expenditure by standard region

Consumers' expenditure measures the expenditure of UK residents whether in the UK or abroad. These figures are not completely comparable with the household income estimates (see technical note 3). Owing to the late availability of the results from the 1987 Family Expenditure Survey (FES) it was not possible to include figures for 1987 in the set of regional accounts published in *Economic Trends, November 1988*. These figures together with revised figures for 1984 to 1986 are given in Appendix Table 5.

Differences between regions in the level of consumers' expenditure per head are influenced by a number of factors, such as relative prices and spending patterns, but necessarily there is a strong correlation with levels of income. Thus consumers' expenditure per head is highest in the South East and lowest in the North, Wales and Northern Ireland. The population structure also influences the level of both income and expenditure. Thus the low average expenditure per capita in Northern Ireland is partly explained by its relatively young population; 25 per cent of the population was aged 14 or under in 1987 compared with 18 to 19 per cent in other regions.

Consumers' expenditure in the UK has been growing strongly since 1981. During this period consumers' expenditure per head in East Anglia, the South East and the South West has grown faster than the UK average. By contrast consumers' expenditure in the North, East Midlands and West Midlands grew relatively slowly. In Yorkshire and Humberside consumers' expenditure has grown in line with the UK average.

The provisional estimates for 1987 suggest that a recovery in consumers' expenditure began in the North West in 1986 and continued into 1987. The estimates for Wales tend to support the income and GDP figures in recording a downturn in the economy in 1986 and 1987, but the FES sample for Wales is particularly small and these results are subject to a greater degree of error than those for other regions. The estimates for Scotland also record a steady slippage in consumers' expenditure per head relative to the UK average from a peak in 1984. The Northern Ireland estimates continue to move erratically.

# Technical notes

## General

1. The regional accounts presented in this article are consistent with the national accounts published in the *United Kingdom National Accounts 1988 edition*, which also defines the terms used.

2. As with the national accounts the estimates, although calculated as accurately as possible, cannot be regarded as accurate to the last digit shown.

## Household Income methodology

3. The household sector is more narrowly defined than the personal sector as it includes only persons living in households and persons living in institutions. The personal sector also includes the funds of pension and life assurance schemes and all private non-profit making bodies: examples of these are universities, trade unions and charities. Household income measures the income of the household sector and is not comparable with estimates of personal income and consumers' expenditure, which measure the income and expenditure of the whole of the personal sector. Regional statistics of personal income and consumers' expenditure have been published annually since November 1976.

4. Wages and salaries of civilian employees is estimated from the pay data recorded on a one per cent sample of National Insurance records held by DSS at Newcastle. Income in kind is assumed to vary directly with wages and salaries. The sampling error of the regional figures varies from  $\frac{1}{2}$  per cent for the South East to nearly 3 per cent for Northern Ireland; the sampling errors for the counties will also vary with the size of the county, but will tend to be greater. Non-sampling errors could also be significant as it is known that the addresses held on DSS records at Newcastle are not all up to date. In areas where migration is large this may affect the county totals leading to possible underestimation of income in growing regions and overestimation of income in counties with decreasing population. This is less likely to be a problem in counties where retired people account for a high proportion of migrants, because pension records and thus the address file are likely to be kept up to date. Fast growing counties where the level of total income and the average may be understated are Cambridgeshire, Northamptonshire, Berkshire and Buckinghamshire. The Newcastle data may also underestimate income in areas with a very mobile population such as the oil-related population in Grampian and the Highlands and Islands. For these two Scottish regions there is a substantial difference between the Newcastle estimates of employment income and those based on employment and earnings statistics. Further work is being undertaken (see technical note 18).

5. Wages and salaries plus income in kind of forces stationed in the UK is assumed to vary directly with the number of forces stationed in the county. The income of forces stationed abroad is allocated to counties in proportion to population.

6. Self-employment income is based on figures for the gross trading profits of the self-employed from the Inland Revenue Survey of Personal Incomes. This is a survey of about 69,000 tax payers stratified by band of income. Sampling error can be high at county level and the data is smoothed over time to reduce the amount of erratic variation.

7. Investment income is based on smoothed figures from the Survey of Personal Incomes. This survey records only taxable income. Income from non-taxable investments e.g. interest from national savings is assumed to vary directly with taxable income.

8. The taxed income from pensions and other benefits from life assurance and superannuation schemes is based on smoothed figures from the Survey of Personal Incomes. The remaining untaxed income is estimated on the basis of national rates per head of population obtained from the Family Expenditure Survey together with relevant population data.

9. Income from social security benefits for standard regions is based on DSS figures for government expenditure by region. Income for counties is estimated from these regional results by using suitable indicators. For example the indicator for unemployment benefit is the number of unemployed and for state pensions it is the number of persons of pensionable age (females aged 60 and over and males aged 65 and over).

10. Other income consists of grants from general government such as rent rebates and allowances, scholarships and awards to students and transfers from private non-profit making bodies (e.g. charities) and from abroad. Rent rebates and allowances are based on housing benefit figures supplied for counties by DSS. Scholarships and awards are estimated in two parts: central government awards and scholarships for students are allocated pro-rata the number of full-time higher degree students at places of study by county and local government awards are pro-rata numbers of full-time and sandwich students on advanced courses. Other grants from government and transfers are distributed pro-rata population.

11. Taxes on income are based on the smoothed results of the Survey of Personal Incomes.

12. National Insurance contributions estimates are drawn from the one per cent sample of records held by the DSS.

13. Contributions to occupational pension schemes are assumed to vary directly with wages and salaries.

## Consumers' expenditure

14. Consumers' expenditure measures expenditure by households and private non-profit making bodies resident in a region. In accordance with national accounts definitions it includes imputed rent for owner-occupied dwellings rather than mortgage payments and the administrative costs of life assurance and superannuation schemes. Consumers' expenditure results are not directly comparable with household income (see technical note 3). There are no estimates of consumers' expenditure by county.

15. The consumers' expenditure estimates are based mainly on the Family Expenditure Survey (FES), supplemented by information from other sources e.g. on rent and education. The FES, like all surveys, is subject to both sampling and non-sampling errors. The

data is smoothed to reduce the effect of sampling error using a centred moving average with a 1:2:1 weighting, but no adjustments are made for non-sampling error except that the FES data are grossed up using regional population estimates. Despite the smoothing process these estimates can be moved erratically and should be used with caution. The *Family Expenditure Survey Handbook* is an excellent source of information on the survey.

#### Continental Shelf

16. Gross domestic product for the Continental Shelf region consists only of profits and surpluses less stock appreciation, which cannot be allocated to standard regions. It does not include income from employment, which is allocated to the region of residence of the employee; there is no resident population in the Continental Shelf region. GDP per head cannot be calculated for the Continental Shelf region, because the population is zero. Therefore the region's GDP is excluded from the United Kingdom total in calculating the national average for inter-regional comparisons. Continental Shelf GDP incorporates profits of both UK and foreign contractors.

#### County GDP

17. County GDP estimates for 1984 were first published in *Economic Trends, January 1988*. Those figures were brought into line with the latest estimates of regional GDP earlier this year, which led to a number of substantial revisions to county GDP even though no revisions were made to the underlying county data for individual components of GDP. The estimates for self-employment income in particular are not consistent with those since developed

for the household income statistics. This inconsistency will be resolved as soon as possible (see technical note 18). Meanwhile comparisons between GDP per head and household income are affected by this problem by under 3 per cent in all counties except Dumfries and Galloway, where the figure is about 7 per cent. The methodology used for the 1984 estimates of county GDP was briefly described in *Economic Trends, January 1988*.

#### Timetable for 1989/90

18. Further development work of county GDP is underway and it is hoped to publish first estimates of county GDP for 1987 together with fully revised estimates for 1977, 1979, 1981 and 1984 in *Economic Trends, November 1989* at the same time as estimates of regional GDP for 1978-88. In order to accommodate this work on county GDP, work on personal sector items usually appearing in the November article will be deferred and these will be published in March or April 1990 together with revised estimates of household income by county.

#### Regional Trends

19. A wider range of statistics for the regions and counties of the United Kingdom can be found in *Regional Trends 1989*, (HMSO) price £19.50 net. The topics covered in *Regional Trends* include population, housing, transport and environment, health, law enforcement, education, employment, industry and agriculture.

						19.7

1. Excluding the Continental Shelf region.

2. From the 1981 census of population.

3. Males aged 65+ and females aged 60+.

4. Gross domestic product for the Continental Shelf region does not include income from employment, which is allocated to the region of residence of the employee. See technical note 16.

5. Estimates of gross domestic product per head cannot be calculated for the Continental Shelf region as there is no resident population in this region.

6. A meaningful unemployment rate cannot be provided for Surrey, because it is not a broadly self-contained labour market.
