

CENTRAL STATISTICAL OFFICE

Economic Trends

**No 462
April 1992**

London: HMSO

Introduction

Economic Trends brings together all the main economic indicators. It contains three regular sections of tables and charts illustrating trends in the UK economy.

'Latest developments' presents the most up-to-date statistical information available during the month. It is important to note that data included in this section may not be wholly consistent with other sections which have gone to press earlier. All data in this section are seasonally adjusted unless otherwise stated. In most cases estimates are provisional and subject to revision.

The main section is based on information available to the CSO on the date printed at the foot of this page and shows the movements of the key economic indicators. The indicators appear in tabular form on left hand pages with corresponding charts on facing right hand pages. Colour has been used to aid interpretation in some of the charts, for example by creating a background grid on those charts drawn to a logarithmic scale. Index numbers in some tables and charts are given on a common base year for convenience of comparison.

The section on cyclical indicators shows the movements of four composite indices over 20 years against a reference chronology of business cycles. The indices group together indicators which lead, coincide with and lag behind the business cycle, and a short note describes their most recent movements. The February, May, August and November issues carry further graphs showing separately the movements in all of the 27 indicators which make up the composite indices.

In addition, quarterly articles on the national accounts appear in the January, April, July and October issues, and on the balance of payments in the March, June, September and December issues. Occasional articles comment on and analyse economic statistics and introduce new series, new analyses and new methodology.

Economic Trends is prepared monthly by the Central Statistical Office in collaboration with the statistics divisions of Government Departments and the Bank of England.

Notes on the tables

1. Some data, particularly for the latest time period, are provisional and may be subject to revisions in later issues.
2. The statistics relate mainly to the United Kingdom; where figures are for Great Britain only, this is shown on the table.
3. Almost all quarterly data are seasonally adjusted; those not seasonally adjusted are indicated by NSA.
4. Rounding may lead to inconsistencies between the sum of constituent parts and the total in some tables.

5. A line drawn across a column between two consecutive figures indicates that the figures above and below the line have been compiled on different bases and are not strictly comparable. In each case a footnote explains the difference.

6. 'Billion' denotes one thousand million.

7. There may sometimes be an inconsistency between a table and the corresponding chart, because the data may be received too late to update the chart. In such cases it should be assumed that the table is correct.

8. There is no single correct definition of *money* and there are many liquid assets which are not included in any of the UK monetary aggregates but which nevertheless need to be taken into account on occasions when interpreting monetary conditions. Consequently, many definitions of money stock are widely used:

M0 the narrowest measure consists of notes and coin in circulation outside the Bank of England and bankers' operational deposits at the Bank.

M2 comprises notes and coin in circulation with the public *plus* sterling retail deposits held by the UK private sector with UK banks, with building societies and in the National Savings Bank ordinary account.

M4 comprises notes and coin in circulation with the public, together with all sterling deposits (including *certificates of deposit*) held with UK banks and building societies by the rest of the private sector.

9. Symbols used:

- .. not available
- nil or less than half the final digit shown
- + alongside a heading indicates a series for which measures of variability are given in the table on page 76
- † indicates that the data has been revised since the last edition; the period marked is the earliest in the table to have been revised
- * average (or total) of five weeks.

The Editor would welcome readers' suggestions for improvements to *Economic Trends*.

Central Statistical Office, 27 April 1992

CSO Databank

Virtually all the series in *Economic Trends* and the Quarterly Articles may be obtained as part of the CSO Databank Service on tape or disk. The appropriate four digit identifier is included at the top of the column or start of a row of figures. This enables users to obtain (in computer-readable form) a much more comprehensive and up-to-date set of long run macro-economic time series data than can be included in this publication. The tape format, unlabelled EBCDIC, is the same for all datasets. The disks, either 3½" or 5¼" are written in ASCII text which can be loaded as spreadsheets and viewed using standard spreadsheet packages, such as LOTUS or SMART.

Details of the service offered and the schedule of charges may be obtained from the Databank Manager, CSO Branch 16, Room 52/4, Government Offices, Great George Street, London, SW1P 3AQ (telephone 071-270 6386). CSO does not offer direct on-line access for these data but a list of host bureaux offering such a facility is available on request from CSO.

Latest developments in the economy

Data available at 30 April 1992

DATA PUBLISHED BY CSO

Output

In the three months to February, the output of the production industries is provisionally estimated to have fallen by 1.0 per cent compared with the previous quarters, and by 1.0 per cent compared with the same period a year earlier. The provisional index of production figure for February is 105.5 (1985=100). The index covers the manufacturing and energy industries, and all figures are seasonally adjusted.

Manufacturing output fell by 0.5 per cent in the three months to February compared with the previous three months, and by 3 per cent on the same period a year earlier. Within manufacturing, between the latest three month periods, the output of the metals industry fell by 1.3 per cent, chemicals by 0.7 per cent, engineering and allied industries fell by 1.1 per cent, "other manufacturing" rose by 0.8 per cent, "other minerals" fell by 1.2 per cent, textiles and clothing by 0.5 per cent, and food, drink and tobacco rose by 0.2 per cent.

The output of the energy sector was 2.0 per cent lower than in the preceding three months, and 4.4 per cent up on the same period a year earlier.

By market sector, between the latest three month periods, the output of the investment goods industries fell by 1.9 per cent, the output of the consumer goods industries rose by 0.8 per cent, and the output of the intermediate goods fell by 1.3 per cent.

Producer prices

The input price index for materials and fuel purchased by manufacturing industry rose by 0.1 per cent in the twelve months to March, following a rise of 0.9 per cent in the twelve months to February. Between February and March, the unadjusted index fell by 0.7 per cent. The seasonally adjusted index fell by 0.5 per cent between the two months.

The increase over twelve months in the output price index for home sales of manufactured products was 4.5 per cent in March, compared with 4.4 per cent in February. The index rose by 0.8 per cent between February and March.

Retail prices

The general index of retail prices for 10 March was 136.7 (January 1987=100), which was an increase of 0.3 per cent on February and an increase of 4.0 per cent since March 1991. Between February and March there were price increases for clothing, footwear and household goods following the sharp reductions in the winter sales. There were also increases in motoring costs, but there were falls in mortgage interest rates.

The tax and price index for March was 129.3 (January 1987=100), representing an increase of 3.5 per cent over the previous twelve months.

Retail sales

The provisional, seasonally adjusted estimate of retail sales volume in March was 119.1 (1987=100). In the three months

to March, sales were unchanged compared with the previous quarter, but 0.5 per cent lower than the same period a year earlier. Sales by food retailers rose by 1.0 per cent compared with the previous three months, and those of specialist non-food retailers were little changed, whereas those of mixed retail businesses fell by 1.5 per cent.

Based on non-seasonally adjusted data, retail sales value in current prices in March was 2 per cent higher than in March 1991.

Balance of payments

Information on visible trade in March and recent trends in invisibles imply a current account deficit of £0.6 billion, £0.1 billion less than in February. In the latest three months the implied deficit was £2.1 billion, compared with £0.6 billion in the previous three months.

The visible deficit in March was £0.9 billion, compared with £1.0 billion in February. In the three months to March the visible deficit was £3.0 billion, compared with £2.6 billion in the previous quarter.

In March the value of exports was £8.9 billion, 0.5 per cent lower than in February. In the three months to March, the value of exports was 0.5 per cent lower than in the previous three months, but 5.0 per cent higher than a year earlier. On a volume basis, excluding oil and the erratic items, exports in the three months to March were little changed from the previous three months, but 4.5 per cent higher than a year earlier.

Imports in March were valued at £9.8 billion, 2.0 per cent lower than in February. In the three months to March, the value of imports was 1.5 per cent higher than in the previous quarter, and 4.5 per cent higher than a year earlier. Excluding oil and erratics, import volume in the three months to March was 3 per cent higher than in the previous three months, and 5.5 per cent higher than a year earlier.

Estimates of invisibles are not available monthly. Based on recent trends and limited information on EC transfers, invisibles in March are projected to be in surplus by £0.3 billion. Revisions to projections can be substantial.

Public sector borrowing requirement

Provisional estimates put the public sector borrowing requirement in March at £6.4 billion. Privatisation proceeds in March amounted to £0.1 billion. The PSBR for the whole of 1991-92 was £13.9 billion compared with minus £0.5 billion in 1990-91. The PSBR excluding privatisation proceeds was £21.8 billion in the whole of 1991-92 compared with £4.9 billion in 1990-91.

DATA PUBLISHED BY OTHER DEPARTMENTS

Official reserves

The overall level of the UK's official reserves fell by \$445 million in March, bringing the end of March reserves to

\$44,310 million (£25,539 million), compared with \$44,755 million (£25,458 million) at the end of February.

The underlying change in the reserves during March was a fall of \$7 million.

The underlying change excludes a number of factors that are included in the total change. Proceeds from the month's tender of UK ECU Treasury Bills amounted to \$1,166 million and maturing UK ECU Treasury Bills of \$1,167 million. The underlying change also excludes repayments of borrowing under the exchange cover scheme of \$437 million. There was no new borrowing under the exchange cover scheme.

Exchange rate

The sterling exchange rate index (1985=100) was 91.3 in April compared with 91.0 in March.

Unemployment and vacancies

In March, the seasonally adjusted level of unemployment in the UK increased by 7,400 to 2.652 million, 9.6 per cent of the workforce. Over the past six months, unemployment has risen by 32,400 per month on average.

The stock of unfilled vacancies at jobcentres increased by 3,200 to a seasonally adjusted 127,500 in the month to March. Over the six months to March, vacancies have increased on average by 3,500 a month.

Employment

The number of employees in employment in manufacturing industries in Great Britain stood at 4,581,000 in February, a fall of 31,000 since January. Employment has fallen by 305,000 in the year to February, 1992, compared with a fall of 196,000 in the previous year.

The UK workforce in employment (employees in employment, the self-employed, HM Forces and participants in work related government training programmes) stood at 25,597,000 in December, representing a fall of 226,000 in the quarter. Employment over the year to December 1991 fell by 997,000.

Earnings

The underlying increase in average weekly earnings in the year to February was about 7.25 per cent, the same as the increase in the year to January. The actual increase in the year to February, at 7.5 per cent, was above the underlying increase because some bonuses paid in February 1991 were paid in different months in 1991.

In the production industries, the underlying increase in average weekly earnings in the year to February was about 7.75 per cent, the same as the increase in the year to January. Within this sector, the underlying increase in manufacturing industries in the year to February was about 7.75 per cent, the same as in the year to January. The actual increases for production and manufacturing in the year to February were 7.9 per cent and 7.8 per cent respectively.

In the service industries, the underlying increase in average weekly earnings in the year to February was about 7 per cent, the same as the increase in the year to January. The actual increase in the service industries was 7.7 per cent.

Productivity

Manufacturing output per head in the three months to February was about 0.5 per cent higher than in the three months ending November, and was 2.9 per cent higher than in the same period a year earlier. Output per head in the whole economy in the fourth quarter of 1991 was about 0.6 per cent higher than in the previous quarter, and about 1.8 per cent higher in the same quarter a year earlier.

Unit wage and salary costs

In the three months to February, wages and salaries per unit of output in manufacturing were 4.5 per cent above the corresponding period a year earlier. This increase was less than the rise in average earnings in manufacturing because of the increase in productivity to 2.9 per cent over this period. In the fourth quarter of 1991, wages and salaries per unit of output in the whole economy were 5.7 per cent above the corresponding period a year earlier. This increase was below the rise in average earnings because of the rise of about 1.8 per cent in productivity over this period.

Monetary aggregates

Provisional information suggests that in the 12 months to March, and before seasonal adjustment, M0 increased by 1.2 per cent, and M4 by 5.6 per cent. In March, again before seasonal adjustment, M0 increased by 0.3 per cent, and M4 increased by 1.2 per cent. After seasonal adjustment, M0 rose by 0.1 per cent, and M4 rose by 0.2 per cent.

UK NATIONAL ACCOUNTS: THE FOURTH QUARTER AND YEAR 1991

This article presents quarterly estimates of the national accounts to the fourth quarter and year 1991. All commentary and charts are in terms of seasonally adjusted data. Estimates of the components of GDP at constant prices are given here in terms of average 1985 prices. Summary estimates of GDP for the fourth quarter of 1991 were first issued on 19 March 1992.

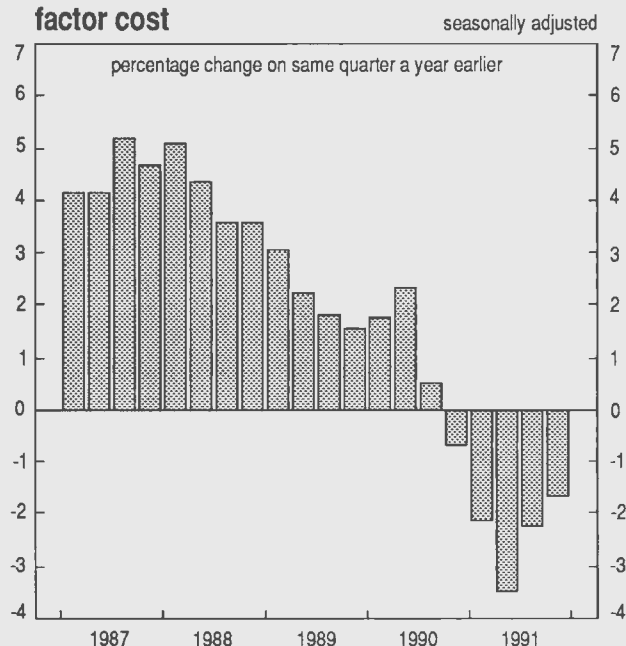

A short description of the United Kingdom national accounts is given as the introduction to the 1991 Edition of "*United Kingdom National Accounts*", otherwise known as "the CSO *Blue Book*". More detailed information is available in "*United Kingdom National Accounts: Sources and Methods*" (HMSO 1985) and subsequent changes to sources, methods and definitions are described in the methodological notes to the 1991 CSO *Blue Book*.

Gross domestic product at current and constant prices

Gross domestic product (GDP) at constant 1985 factor cost was 2.4 per cent lower in 1991 than in 1990. Between the third and fourth quarters of 1991 GDP at constant 1985 factor cost fell 0.3 per cent to a level 1.7 per cent lower than in the fourth quarter of 1990.

Chart 1 shows recent changes in GDP each quarter compared with the same quarter a year earlier. Chart 2 shows changes in GDP, for each quarter on a quarter earlier.

Chart 1
GDP at constant 1985
factor cost

Fluctuations in the output of the oil and gas extraction industries in recent quarters obscure the profile of changes in the level of activity elsewhere in the economy. GDP, excluding oil and gas production, fell 0.4 per cent between the third and fourth quarters of 1991 and 2.7 per cent between 1990 and 1991.

Chart 2
GDP at constant 1985
factor cost

GDP at current factor cost was 3.8 per cent higher in 1991 than in 1990. Between the fourth quarters of 1990 and 1991 it increased 3.1 per cent and GDP at current market prices - also known as "money GDP" - by 5.3 per cent.

The implied factor cost GDP deflator ("index of total home costs") rose by 6.3 per cent between 1991 and 1990. Between the fourth quarters of these years it increased 4.9 per cent.

The real income of the United Kingdom, as shown by gross national disposable income at constant market prices, fell 0.9 per cent between the latest two years. Between the third and fourth quarters of 1991 it increased 0.4 per cent.

Estimates of GDP at current and constant prices, of real national disposable income and of the implied GDP deflator are given in index number form in Table A. This is supplemented by information presented in Table A1 of the Appendix.

Revisions to GDP estimates and the main components, since the last set of quarterly estimates appeared in the January 1992 issue of *Economic Trends*, are described later in this article.

Estimates of GDP at constant factor cost are at constant 1985 factor cost, following both UK and recommended international practice of rebasing every five years using the years ending 0 and 5 as the reference year. Since 1985, the relative prices of various goods and services have changed, including a very large reduction in oil prices up to the third quarter of 1990. The implications of this reduction for interpretation of GDP growth assessments are outlined in the Notes at the end of this article.

	Value indices at current prices		Volume indices at 1985 prices			Implied gross domestic product deflator ⁴	
	Gross domestic product at market prices ²	Gross domestic product at factor cost	Gross national disposable income at market prices ³	Gross domestic product at market prices	Gross domestic product at factor cost	At market prices	At factor cost ⁵

Percentage change, latest quarter on previous quarter							
1991 Q4	0.9	0.5	0.4	-0.1	-0.3	1.0	0.8
Percentage change, latest quarter on corresponding quarter of previous year							
1991 Q4	5.3	3.1	-0.3	-1.2	-1.7	6.5	4.9

1 These estimates are given to one decimal place but this does not imply that they can be regarded as accurate to the last digit shown. Estimates at current market prices are affected by the abolition of domestic rates and the introduction of the community charge.

2 'Money GDP'.

3 Also known as Real national disposable income (RNDI).

4 Based on sum of expenditure components of GDP at current and constant prices.

5 Also known as the Index of total home costs.

Expenditure at constant 1985 prices (Table A2)

At constant prices, consumers' expenditure was down 1½ per cent in 1991 compared with 1990. General government final consumption increased 2½ per cent over the same period, while fixed investment fell by 10 per cent. Stock levels fell £2.9 billion in 1991 following a smaller fall in 1990.

At constant 1985 prices, total domestic expenditure (which is the sum of consumers' expenditure, general government final consumption, fixed investment and stockbuilding) decreased by 3 per cent between the years 1990 and 1991 and 1½ per cent between the fourth quarters of these years. Net imports of goods and services fell from £15.0 billion in 1990 to £10.1 billion in 1991.

Between the fourth quarters of 1990 and 1991, consumers' expenditure declined 1½ per cent and fixed investment by 8½ per cent. General government final consumption increased by 2 per cent while net imports of goods and services fell from £3.1 billion to £2.5 billion.

Income at current prices (Table A3)

Income from employment increased 5½ per cent in 1991 compared with 1990 and 4½ per cent between the fourth quarters of these years.

The gross trading profits of the corporate sector fell 7½ between 1990 and 1991 and were lower than in the fourth quarter of last year. The total domestic income grew by 3 per cent between the two years. Separate comparisons of the gross trading profits of companies and the gross trading surplus of public corporations over these periods are affected by the privatisation of the electricity companies between December 1990 and June 1991.

Output at constant 1985 prices (Table A4)

The output of the production industries fell 3 per cent between 1990 and 1991, made up of a 4 per cent increase in the output of the energy and water industries and a 5 per cent drop in the output of the manufacturing industries. Over the same period, construction output fell 9 per cent and the output of service industries was down

by 1½ per cent. Within the service sector, the output of the distribution, hotels and catering industries was down 3 per cent, transport and communications industries 3½ per cent and the output of other service industries' fell ½ per cent.

The output of the production industries was broadly unchanged between the third and fourth quarters of 1991. Within production, the output of the energy and water industries up 3 per cent but manufacturing output down 1½ per cent. There was a drop of 1½ per cent in the output of the construction industry. Over the same period, total output of the service industries remained broadly unchanged.

Personal income, expenditure and saving (Table A5)

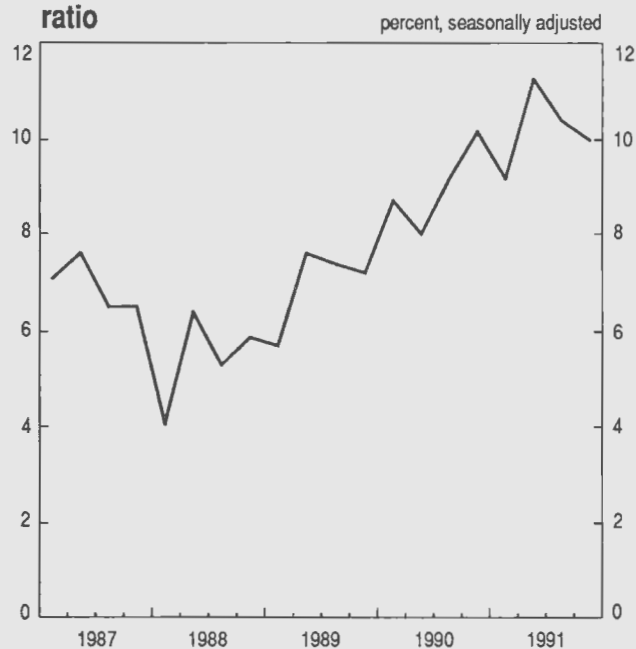

In 1991, real personal disposable income (RPDI) was ½ per cent lower compared with 1990. RPDI declined by ½ per cent between the third and fourth quarters of 1991 to reach a level 1½ per cent lower than in the fourth quarter of 1990.

Total personal income before deductions, at current prices, grew 6 per cent between 1990 and 1991. Within this total, wages and salaries rose by 5 per cent, employers' contributions by 6 per cent, current grants from general government increased 16 per cent and other personal income, which includes dividends, increased 3½ per cent. Total personal income grew 1 per cent between the third and fourth quarters of 1991 to a level 4½ per cent above that in the fourth quarter of 1990.

Personal disposable income increased by 1 per cent between the third and fourth quarters of 1991. Prices, as measured by the consumers' expenditure deflator rose by 1½ per cent.

For the year as a whole, the saving ratio was 10 per cent in 1991 compared with 9 per cent in 1990. Between the third and the fourth quarters of 1991 it fell from 10½ per cent to 10 per cent. The saving ratio over recent years is shown in Chart 3.

Chart 3
Personal sector saving ratio

Consumers' expenditure (Table A6)

Consumers' expenditure at constant prices fell 1½ per cent between 1990 and 1991. Within this total, expenditure on durable goods showed a 7 per cent fall while expenditure on non-durable goods remained broadly the same. Amongst durable goods, expenditure on vehicles fell by 17 per cent and expenditure on furniture and floor coverings declined by 3 per cent. Among non-durable items, spending on clothing declined by 1 per cent and on footwear by 2 per cent but spending on food increased by 1 per cent. Over the same period, spending on energy products increased by 3 per cent, but expenditure on services dropped by 2 per cent.

In the fourth quarter of 1991, consumers' expenditure at constant prices was broadly unchanged on the previous quarter, but was 1½ per cent lower than in the fourth quarter of the previous year. Between the fourth quarters of 1990 and 1991, expenditure on durable goods fell by 4 per cent and on services by 3 per cent. Spending on non-durable goods remained broadly the same. Chart 4 shows the changes in consumers' expenditure on durable goods and on other goods and services.

Chart 4
Consumers' expenditure

Industrial and commercial companies (Table A8)

It is estimated that, after deducting stock appreciation, UK trading profits of industrial and commercial companies declined by 2 per cent between 1990 and 1991. In the fourth quarter of 1991 they were higher than a year earlier. Quarterly estimates of UK trading profits of these companies include quarterly alignment adjustments, which are described in the Notes at the end of this article. In recent years, the sector has been increasing in coverage owing to the privatisation of many public corporations.

Between the latest two quarters, gross trading profits (net of stock appreciation) of North Sea oil companies increased by 13 per cent but were 19 per cent lower than a year earlier. For 1991 as a whole, gross trading profits (net of stock appreciation) of North Sea oil companies were 10 per cent lower than 1990.

The gross trading profits (net of stock appreciation) of non-North Sea industrial and commercial companies are estimated to have fallen 1 per cent between 1990 and 1991. In the fourth quarter of 1991, profits were higher than a year earlier.

UK industrial and commercial companies' rent and non-trading income from UK sources were down by 4 per cent between 1990 and 1991, and their income from abroad fell by 15 per cent.

Payments of dividends on ordinary shares (excluding payments by UK subsidiaries to their overseas parent companies, and net of payments to other UK industrial and commercial companies) fell 1 per cent in 1991 compared with 1990.

Payments of UK taxes on income were 20 per cent lower in 1991 than in 1990. In the fourth quarter these payments were 22 per cent lower than in the corresponding quarter of 1990. Profits due abroad fell 16 per cent between 1990 and 1991. In the fourth quarter of 1991 they were 20 per cent lower than in the third quarter and 21 per cent lower than the fourth quarter of 1990.

These estimates suggest that the broad measure of UK industrial and commercial companies' undistributed income (that is, before deducting stock appreciation or net unremitted profits) was £35.8 billion in 1991 compared with £36.2 billion in 1990.

Public corporations (Table A10)

The gross trading surplus of public corporations (after deducting stock appreciation) were a quarter lower in 1991 than 1990. Comparisons are, however, affected by the privatisations of the electricity distribution companies in England and Wales in December 1990, the electricity generation companies in England and Wales in March 1991 and the Scottish electricity companies in June 1991. In addition, National Health Service Trusts are included in this sector from their establishment in April 1991.

Central government (Table A11)

Total central government receipts increased 6 per cent between 1990 and 1991. Taxes on income fell by 2 per cent while taxes on expenditure rose by 16 per cent. Net receipts of national insurance contributions grew by 6 per cent.

Total current expenditure of central government increased by 10 per cent between 1990 and 1991. Within this total, expenditure on final consumption (military defence, health services, etc) rose by 11 per cent and expenditure on subsidies, grants and debt interest combined increased by 10 per cent.

The slower rise in income than expenditure led to a fall in the surplus of the current account from £8.5 billion in 1990 to £1.0 billion in 1991.

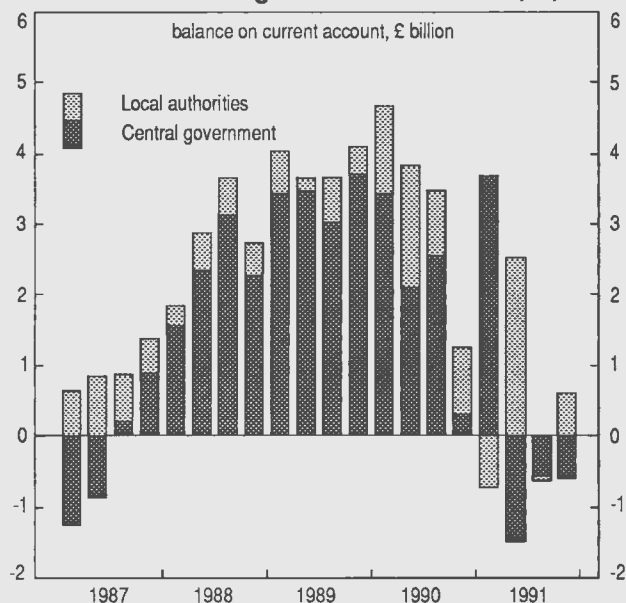

Local authorities (Table A12)

Total current receipts of local authorities were 6 per cent higher in 1991 than 1990.

Total current expenditure rose 11 per cent between 1990 and 1991 with expenditure on final consumption up 10 per cent over this period and expenditure on subsidies, grants and debt interest combined up 14 per cent. The surplus on the current account fell from £4.8 billion in 1990 to £2.3 billion in 1991.

The quarterly balances on the current accounts of central government and local authorities over recent years are shown in Chart 5.

Chart 5
Central and local government seasonally adjusted

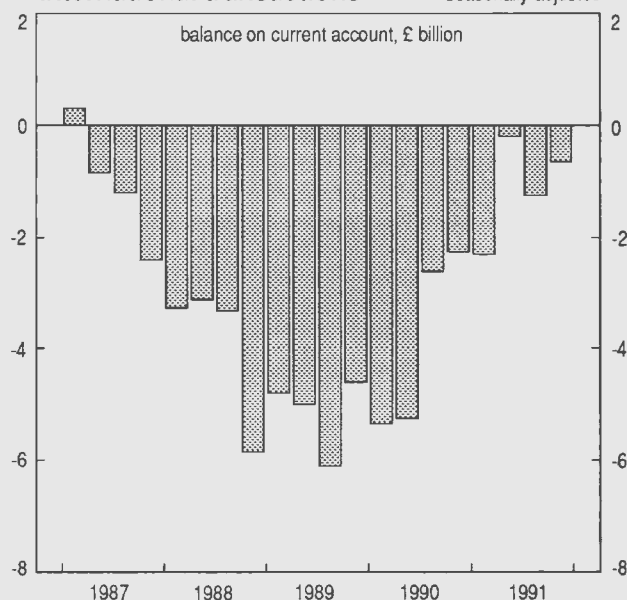

International transactions (Tables A13 and A14)

At current prices, exports of goods were up 2 per cent in 1991 compared with 1990 and exports of services were 1 per cent higher. Property income from abroad fell by 3 per cent over the same period and total UK current account credits, including transfers, increased by 1 per cent.

At current prices, imports of goods fell by 6 per cent between 1990 and 1991 and imports of services by 1 per cent. Over the same period property income paid abroad declined by 1 per cent and overall UK current account debits, including transfers, dropped by 4 per cent.

The quarterly balance of the current account over recent years is shown in Chart 6.

Chart 6
International transactions seasonally adjusted

At constant 1985 prices, exports of goods rose 2 per cent between 1990 and 1991 but exports of services fell by 3 per cent. Over the same period imports of goods fell by 3 per cent and imports of services by 4 per cent.

Gross domestic fixed capital formation at 1985 prices (Tables A15 and A16)

Total fixed investment at constant 1985 prices, is estimated to have been 10 per cent lower in 1991 than 1990. Fixed investment by the private sector fell by 11 per cent, general government by 2 per cent and public corporations declined by a fifth (though this comparison is somewhat distorted by privatisations). The quarterly profile of fixed investment over recent years is shown in Chart 7.

Chart 7

Gross domestic fixed capital formation

Fixed investment fell between 1990 and 1991 for each type of asset.

Value of physical increase in stocks and work in progress at 1985 prices (Table A17)

Stock levels for the whole economy, expressed at constant 1985 prices, fell by £2.9 billion in 1991 following a smaller fall in 1990. Destocking is evident in manufacturing, wholesaling and retailing industries while energy and water supply and other industries show stockbuilding.

Revisions (Table A18)

Estimates of GDP are subject to revision as more information becomes available. Table A18 compares latest estimates with those in the quarterly article on UK national accounts in the January 1992 edition of *Economic Trends*.

There were no revisions to GDP components prior to 1989. Later and more complete estimates of GDP components in 1989 and 1990, have had little impact on the assessment of GDP at constant 1985 prices.

NOTES

CSO has indicated for several years that the average of estimates compiled on the expenditure, income and output approaches to the measurement of GDP should be regarded as the definitive estimate. All references to GDP in this article and other CSO publications, relate to this average. The CSO continues to publish GDP analysed by its income, expenditure and output components. These are shown in Table A19.

Interpretation of estimates at market prices

GDP estimates, and those for consumers' expenditure, have been affected since the second quarter of 1989 by the abolition of domestic rates in Great Britain and the introduction of the community charge. In national accounts, domestic rates are classified as a tax on expenditure whereas the community charge is treated as a deduction from income.

Estimates of consumers' expenditure, GDP and GNP aggregates at current market prices for the second quarter of 1989 onwards are therefore lower than they would have been if the community charge had not replaced domestic rates. A fuller description of the change in the series appeared in the August 1989 issue of *Economic Trends* (No 430).

Interpretation of estimates at constant prices

In the interpretation of quarterly and annual national accounts estimates, special attention needs to be paid to the higher margins of error attaching to series estimated at constant prices when the rate of inflation is changing significantly. Movements in exchange rates may also affect the valuation of international transactions.

National accounts estimates at constant prices are made at average 1985 prices and indices calculated in terms of 1985=100. Interpretation of estimates at constant prices should bear in mind that the choice of base year can affect significantly assessment of GDP growth rates where sharp changes in relative prices occur. In this connection it may be noted that the relative price of oil products was much higher in 1985 than today, with the result that GDP estimates at constant 1985 prices give a much larger weight to the recent variations in the UK oil production than would be the case if estimates of GDP at constant prices were made in terms of a more up to date price structure.

Coherence in GDP estimates

In order to achieve coherence between the output, expenditure and income approaches to measurement of gross domestic product, some modifications have been made to the initial estimates of various components within the likely error range of the data. In particular, the annual estimates of income from employment, have been reduced by £1000 million in 1988 and £1500 million in 1989; estimates for self-employment income (included within Other personal income) have been reduced by £300 million in 1989 and increased by £700 million in 1990; estimates of the gross trading profits of non-North Sea industrial and commercial companies have been reduced by £800 million in 1986, £1,200 million in 1987, £1,600 million in 1988 and £200 million in 1989; they have been increased by £900 million in 1990, and this has been projected forward into 1991. Upward modifications have also been made to the annual estimates of stockbuilding from 1988 onwards.

Quarterly alignment adjustments

To improve the coherence of the quarterly accounts, some adjustments are made to quarterly estimates of both the expenditure and income analyses of GDP for 1983 onwards. These adjustments sum to zero across each of the years 1983 to 1991. They are attributed where accurate measurement are most difficult, to gross trading profits of companies and stockbuilding.

These quarterly adjustments modify the aggregates derived from expenditure or income components so that they better reflect the quarter to quarter paths suggested by output. (CSO has always indicated output estimates yield the best short term indicator of growth.) For profits the alignment adjustments are constrained within the likely error range attaching to the estimated quarterly path of profits. The impact of this constraint on the quarterly path of GDP, which is calculated as the average of expenditure, income and output analyses, is small.

The alignment adjustments included in estimates in this article are as follows:

Table B

¹ Estimates are given to the nearest £ million and in case of indices to one decimal place but cannot be regarded as accurate to this degree. Estimates at current market prices are affected by the abolition of domestic rates and the introduction of the community charge.

² Equals taxes on expenditure less subsidies.

³ The factor cost estimate of GDP is obtained from the market price estimate by subtracting the factor cost adjustment.

⁴ Gross national product equals Gross domestic product plus Net property income from abroad.

⁵ Represents Taxes on expenditure less Subsidies both valued at 1985 prices.

1 Estimates are given to the nearest £ million but cannot be regarded as accurate to this degree.

2 This series is affected by the abolition of domestic rates and the introduction of the community charge.

3 Quarterly alignment adjustment included in this series. For description of adjustment see notes.

Domestic expenditure on goods and services at market prices														
	General government final consumption				Gross domestic fixed capital formation	Value of physical increase in stocks and work in progress ²	Total	Exports of goods and services	Total final expenditure	Imports of goods and services	Statistical discrepancy (expenditure)	Gross domestic product at market prices	less Factor cost adjustment ³	Gross domestic product at factor cost
	Consumers' expenditure	Central government	Local authorities	Total										
Revalued at 1985 prices

1 Estimates cannot be regarded as accurate to the last digit shown.

2 Any differences between this column and the data on page 28 arise because the latter may be based on later information.

3 Embraces an implicit statistical discrepancy compared with the sum of the previous columns, because GDP takes account of other information based on incomes and expenditures.

A5 Personal income, expenditure and saving

£ million

	Personal income before tax										Total personal disposable income ^{2,3,4}	Consumers' expenditure ⁴	Balance: personal saving ³	Saving ratio ⁵	Consumers' expenditure implied deflator (1985=100) ⁴	Real personal disposable income at 1985 prices (£m) ⁶	Index of real personal disposable income (1985=100)

1 Before providing for depreciation and stock appreciation.

2 Equals total personal income before tax less payments of taxes on income, social security contributions and other current transfers.

3 Before providing for depreciation, stock appreciation and additions to tax reserves.

4 This series is affected by the abolition of domestic rates and the introduction of the community charge (see notes at the end of the article).

5 Personal saving as a percentage of total personal disposable income.

6 Personal disposable income revalued by the implied consumers' expenditure deflator (1985 = 100).

1 Figures reflect privatisation of British Telecom with effect from 28 November 1984, British Gas from 3 December 1986, British Airways from 6 February 1987, Royal Ordnance from 22 April 1987, BAA from 16 July 1987, British Steel from 2 December 1988, water companies from 12 December 1989, electricity distribution companies from 11 December 1990, electricity generating companies from 12 March 1991 and Scottish electricity generating companies from 18 June 1991.

2 Quarterly alignment adjustment included in this series. For description of this adjustment, see Notes.

3 Before providing for depreciation.

4 Dividend payments on ordinary and preference shares are net of tax; the advance corporation tax in respect of such payments is included in 'UK taxes on income'. Excludes dividends and debenture interest paid by UK subsidiaries to their overseas parents.

5 Including royalties and licence fees on oil and gas production.

6 Mainly payments of corporation tax (including advance corporation tax), petroleum revenue tax and supplementary petroleum tax.

7 Before providing for depreciation, stock appreciation and additions to reserves.

1 Figures reflect privatisation of British Telecom with effect from 28 November 1984, British Gas from 3 December 1986, British Airways from 6 February 1987, Royal Ordnance from 22 April 1987, BAA from 16 July 1987, British Steel from 2 December 1988, water companies from 12 December 1989, electricity distribution companies from 11 December 1990, electricity generating companies from 12 March 1991 and Scottish generating companies from 18 June 1991.

2 Before providing for depreciation.

3 Quarterly alignment adjustment included in this series. For description of adjustment, see Notes.

4 Dividend payments on ordinary and preference shares are net of tax; the advance

corporation tax in respect of such payments is included in 'UK taxes on income'. Excludes dividends and debenture interest paid by UK subsidiaries to their overseas parents.

5 Including royalties and licence fees on oil and gas production.

6 The difference between all companies payments and financial companies and institutions' payments of taxes on income. The former include payments of corporation tax (including advance corporation tax), petroleum revenue tax, and supplementary petroleum tax.

7 Before providing for depreciation, stock appreciation and additions to reserves.

1 Before providing for depreciation and stock appreciation.

2 This represents the contribution of financial companies and institutions to the gross domestic product. It is the difference between bank charges, commissions, etc., on the one hand and management expenses (wages and salaries and payments for current expenses) on the other.

3 Dividend payments on ordinary and preference shares are net of tax; the advance corporation tax in respect of such payments is included in 'UK taxes on income'. Excludes dividends and debenture interest paid by UK subsidiaries to their overseas parents.

4 Before providing for depreciation, stock appreciation and additions to reserves.

1 Accruals for the quarter. From April 1990 rates relate to district councils in Northern Ireland.

2 Replaced domestic rates in Scotland from April 1989 and in England and Wales from April 1990.

3 Before providing for depreciation and stock appreciation.

1 This balance is equal to savings plus capital transfers less gross domestic formation.

2 Before providing for depreciation, stock appreciation and additions to reserves.

3 Equal to stock appreciation plus value of physical increase in stocks and work in progress.

4 Equals, apart from the change in sign, the financial surplus or deficit of the overseas sector.

5 Excluding financial transactions on the writing-off of debt.

6 Gross and net fixed capital formation by the personal sector excludes that by Life assurance and pension funds; this is included with that of Financial companies and institutions.

7 Figures for companies and public corporations are affected by privatisation.

1 Estimates are given to the nearest £ million but cannot be regarded as accurate to this degree.

2 The industry analysis of Gross domestic fixed capital formation includes vehicles, ships and aircraft, plant and machinery as well as new buildings and works other than dwellings. It excludes fixed investment in dwellings and the transfer costs of land and existing buildings.

3 The numbered Divisions referred to are those of the Standard Industrial Classification, Revised 1980.

4 Including transfer costs of land and existing buildings.

1 For years up to and including 1982, the totals differ from the sum of the components because of the method used to rebase on 1985 prices.

2 Further details are given in the *Monthly Digest of Statistics*.

3 Excluding wholesale distribution of motor vehicles, parts and accessories.

4 Excluding retail distribution of motor vehicles and parts, and filling stations.

5 Quarterly alignment adjustment is included in this series. For description of this adjustment, see notes.

6 Differences between totals and the sum of constituent parts of manufacturing are due to rounding.

7 Book values of stocks on left hand side, constant 1985 prices on right.

8 First and second quarter 1989 estimates include adjustments (+£300m and -£300m respectively) to offset distortion to total stocks estimates otherwise caused by Easter falling in March 1989.

1 The Residual error is, by convention, the amount by which the expenditure -based approach to measuring GDP exceeds the income-based estimate. It is also the sum of two components: Statistical discrepancy (expenditure) with sign reversed, and the Statistical discrepancy (income) with natural sign.

2 Income data deflated by the Implied GDP deflator at factor cost, based on expenditure data.

Regional Accounts 1990: part 2

Introduction

This article presents provisional estimates of personal income, personal disposable income, household income, household disposable income and consumers' expenditure by region for 1990 together with estimates of household income and household disposable income by county for 1985, 1987 and 1989.

Regional Accounts 1990: Part 1 was published in *Economic Trends*, November 1991 and comprised estimates of counties' total gross domestic product in 1989 and regional estimates of gross domestic product and gross domestic fixed capital formation (GDFCF).

Background

Scotland, Wales, Northern Ireland and the regions of England are all different in size, character, industrial structure and economic performance. Table A shows some of the differences in size of the regions. Scotland has the largest area, but has a small population relative to its size; the North West has the smallest area, but the second largest population. The South East like the North West is very densely populated and as it is also large in area its population of over 17 million is nearly three times as large as any other region. Northern Ireland at the other extreme has a population of only 1.6 million. These large variations in regions' populations are, of course, reflected in the size of regional GDP. Table A shows that this varied in 1990 from £10 billion in Northern Ireland to £169 billion in the South East.

Due to the wide variation in the sizes of regions, comparisons of regional accounts aggregates such as total personal income are usually made in terms of amounts per head. It is important to note however that in regions where the population has increased or

decreased significantly, the growth in total regional income or expenditure may be quite different to the growth per head. Furthermore the level of income per head is determined both by the earnings of the working population and the proportion of dependents. Northern Ireland households for example have a high proportion of children (25 per cent of the population was aged 14 or under in 1990 compared with 18 to 19 per cent in most regions). This will tend to depress income and expenditure per head in the province relative to other regions. The age structure of the population should thus be taken into account in comparisons between regions and to an even greater extent in comparisons between counties.

All the items are measured in current prices which means that increases over time reflect inflation as well as real growth. Trends in total income and expenditure per head cannot be analysed easily without deflating the data. However, there are no regional or county price indices, which could be used to remove the effect of inflation from the figures. Comparisons of trends can therefore be based either on the difference between regional increases at current prices or on movements in the amount relative to the UK average. Both approaches would be misleading if the rate of inflation in any region were different from the national average.

In the regional accounts it is usual to look at changes per head relative to the UK average over time. However this obscures the effect of changes in population size on the total income and expenditure of an area. In counties where the population is increasing most rapidly, growth in total income and expenditure would be expected to grow relatively strongly; conversely, counties with a low or negative population growth would be expected to grow more slowly. Cambridgeshire, for example, has experienced a relatively high rate of population growth and total household income is certainly growing faster than the UK average; the same is not necessarily true of income per head.

Basic Regional Statistics

¹ Provisional.

² Excluding the Continental Shelf region.

³ The regional estimates of GDP are income-based and are linked to the average estimate of United Kingdom GDP by a statistical discrepancy.

Personal income

The year to year changes in the regions' shares of personal income per head are relatively small compared to the long-standing differences in levels. Thus personal income per head in Northern Ireland, Wales and the North remains substantially below the UK average whilst that in the South East remains substantially above it. Provisional estimates for 1990 suggest that South West and Yorkshire and Humberside have grown most strongly, whilst in Northern Ireland and South East growth has been below average. It should be stressed however that undue reliance should not be placed on year on year comparisons as the estimates, particularly the provisional figures for 1990, may be revised substantially as better information becomes available.

Over a longer period, trends in regions' incomes are more stable and Appendix table 1 shows total personal income from 1980 to 1990. Over this period the percentage increases in personal income have been greatest in East Anglia, the South East and the South West. Within the South East, however, the growth of personal income in Greater London has been below the UK average, whilst that of the rest of the South East has been substantially above it. The increases in personal income have been least rapid in Wales, the North and North West.

Personal disposable income

Personal disposable income is defined as personal income less taxes on income, social security contributions, community charge, and current transfers (see technical note 8), and trends in regional personal disposable income closely follow trends in personal income. As with personal income, many of the differences in regions' levels of personal disposable income per head are long-standing. The redistributive effects of personal taxation and National Insurance contributions however, means that differences in the level of personal disposable income are slightly smaller than differences in personal income. Thus while regions' personal income ranged from 81 to 116 per cent of the UK average in 1990, personal disposable income ranged from 86 to 114 per cent. Community charge, which replaced domestic rates in Scotland from April 1989 and in England and Wales from April 1990, introduced a discontinuity in the personal disposable income series. 1989 and 1990 figures for Scotland, and 1990 figures for England and Wales, are not comparable with other figures: see technical note 11.

Consumers' expenditure

Consumers' expenditure measures the expenditure of UK residents whether in the UK or abroad. These figures include the expenditure of private non-profit making bodies which serve persons and are therefore comparable in coverage with the estimates of personal rather than household income. However, the margins of error on both sets of figures make it unwise to compare the two in practice. Appendix table 3 shows regional consumers' expenditure from 1980 to 1990 both in total and per head; table 4 gives a breakdown by broad category of expenditure for 1987 to 1990. The estimates for 1990 are provisional.

The estimates are largely based on the results of the Family Expenditure Survey and the accuracy of the estimates cannot be greater than that of the survey. The FES results are subject both to sampling error and non-response bias.

Differences between regions in the level of consumers' expenditure per head are influenced by a number of factors, such as relative

prices and spending patterns, but necessarily there is a strong correlation with levels of income. Thus consumers' expenditure per head is lowest in Northern Ireland and the North. As mentioned earlier, the population structure will also influence levels of income and expenditure, and thus the low average expenditure in Northern Ireland is partly explained by its high proportion of children. The South East has the highest expenditure per head and within this region it is substantially higher in Greater London than in the rest of the South East.

Recent trends in regions' shares of consumers expenditure are difficult to interpret due to the replacement of domestic rates with the community charge which took place in 1989 in Scotland and in 1990 in England and Wales. Community charge, unlike expenditure on rates, is not included in consumers' expenditure: see technical note 11. However it seems likely that the long term trends in regions are broadly continuing: throughout much of the 1980s, expenditure per head grew more strongly than the national average in the South East and South West whilst growth was least strong in the North and West Midlands. Domestic rates continue to be a part of Consumers' Expenditure in Northern Ireland, and so the 1990 Northern Ireland estimate includes a component not included in the other UK regions. The 1990 increase in Northern Ireland's Consumers' Expenditure per head compared to the UK average may not therefore reflect an improvement in Northern Ireland's true standing.

Household income

Household income and disposable income have been estimated by region for the years 1984 to 1990, and by county for the years 1984 to 1989. The 1990 regional estimates are provisional. Appendix table 5 shows household income by region and source of income from 1987 to 1990. Tables 6 and 7 give county estimates of household income and household disposable income respectively, both in total and per head for 1985, 1987 and 1989. It should be noted that household income has a narrower coverage than both personal income and consumers' expenditure; see technical note 12 for further discussion of the scope of these concepts. There are also two significant points affecting the quality of the estimates. Firstly the results may tend to underestimate income in fast-growing counties and vice-versa; secondly the results for small counties will be less reliable than those for larger counties as sampling error is greater (see technical note 13). As is the case with estimates for GDP, it has been considered necessary to combine the results for the smallest counties with those for neighbouring counties due to the effects of these errors.

Sources of household income

The sources of household income are shown by region for 1990 in table B. For all regions, income from employment is by far the most important source of income, accounting for around three-fifths of total income. However there is some variation between regions in the relative importance of the sources. In the South East and the North, 61 per cent of income is from employment, whilst in the South West this proportion is 54 per cent. The variations between the regions are more marked for some of the other components of household income due to both demographic and economic reasons. For example the higher proportion of state and occupational pensions in the South West is a reflection of the larger proportion of retired people in the region. Similarly, self-employment income is relatively most important in East Anglia, and Northern Ireland, (13 or 14 per cent of household income in 1990) reflecting partly the importance of agriculture to these areas' economies. The relative weight of income from

Sources of household income by region in 1990¹

Northern Ireland	54	13	6	13	11	3	10 485

1. Provisional

investment varies greatly between regions: it is more than twice as important in the South West, than in the North and Northern Ireland. Social security benefits make up the lowest proportion of income in the South East and South West, both at 4 per cent, but are relatively most important in Northern Ireland at 13 per cent. These variations will be greater at county level, but the analysis is subject to a greater degree of sampling error and has not been presented here.

Recent trends in household income by region

Trends in regions' household income over the seven years 1984 to 1990 are difficult to discuss due to the erratic nature of several of the series. Also, it should be borne in mind that the figures for 1990 are provisional, and those for 1984 are affected by special factors - the miners' strike and the exceptionally good grain harvest - which makes this year atypical for some regions. The figures in table C however, suggest that disposable income per head in the South West and the West Midlands grew most quickly, while that in Northern Ireland, Wales and the North increased less rapidly over the period.

Household income by county

Total household income is given in Appendix table 6. Levels in 1989 varied from £59 billion in Greater London to under £1 billion for some of the least populous counties. Due to the large differences in counties' populations, comparisons between regions and counties are usually made in terms of household income per head. Household income per head is estimated to have been highest in Surrey (£10,264 in 1989) and lowest in Mid Glamorgan (£5,669). These comparisons make no allowances for the different costs of living in different parts of the UK and therefore cannot be interpreted as precise measures of comparative living standards.

Trends in counties' household income per head must be considered even more cautiously than those for the regions, since the counties' shares of personal income are subject to considerable year-to-year fluctuations.

Since for some counties the exceptional factors in 1984 are even more important than for the regions, figures in tables 6 and 7 show large changes between the years 1985, 1987 and 1989. Over

Household disposable income per head (UK=100)

1. Provisional

this period, some counties have seen significant changes in household income per head compared to the UK average. The largest increases from 1985 to 1989 were in Hertfordshire and Surrey up from 119 and 131 per cent respectively, to 133 and 142 per cent. Northumberland on the other hand fell from 100 per cent to 88 per cent.

Disposable household income by county

Disposable household income is defined as household income less payment of tax, National Insurance and contributions to life assurance and pension schemes. In 1989 household disposable income ranged from £7,791 per head in Surrey to £4,559 in Mid Glamorgan. As might be expected there is less variation in per capita levels of disposable income than in total household income, however the overall effect on the dispersion of county income is not great. Household disposable income per head ranged from 78 per cent of the UK average for the lowest county to 134 per cent for the highest in 1989 compared with 78 per cent to 142 per cent for total household income per head.

Comparisons with GDP

Gross domestic product (GDP) tends to be used as an all-purpose measure of counties' economic well-being. However, it is important to understand its deficiencies in this field. This section of the article compares the GDP estimates for 1989 published in the November 1991 *Economic Trends* article with these new estimates of household income (see Appendix Table 8). The conceptual difference between the two is that household income measures the income of residents of a county, whereas gross domestic product measures the value of goods and services produced in the county. This conceptual difference manifests itself in the county estimates in three main ways. Firstly there is a difference in the treatment of commuters' income, which affects some counties significantly. Secondly the proportions of economically inactive persons affects the per capita levels of household income and GDP in different ways. Thirdly company profits are included in the GDP of the county where companies are located, whereas household income includes dividends and interest received by the household sector. These differences are discussed further in the following paragraphs.

The number of commuters affects the relative levels of household income and GDP because the employment income of commuters is included in the GDP of the county where they work, but in the household income of the county where they live. There are no data on commuting yet available from the 1991 Census of Population and so data from the 1981 census are used. Table 8, column 5 gives the net inflow of employed persons as a percentage

of resident numbers employed. It can be seen that, as would be expected, counties with a significant net outflow of commuters tend to have lower relative GDP per head than household income. This can be seen most clearly for Surrey, Hertfordshire and Essex. Conversely counties with a net inflow like Greater London, South Glamorgan and West Midlands county area have higher relative GDP per head than household income.

Economically inactive persons will receive income from sources other than employment which are included in household income but not GDP. Pensioners, for example, have income from pensions and other sources which is included in household income, but they do not receive income from producing goods and services which would be included in GDP. Thus the numbers of retired people explains some of the differences between household income and GDP and is hence given in Table 8 at column 6. Household income per head will be relatively higher compared with GDP per head for counties with an above average proportion of retired people such as East Sussex, Isle of Wight, Dorset and West Sussex. Similarly, unemployed persons receive benefits and unemployment rates are also shown in Table 8 at column 7. The high percentages of unemployed in Merseyside and Fife for example partly explain the differences between the relative level of household income and GDP per head in these areas.

Company profits and trading surpluses of public enterprises can contribute a substantial proportion of a counties' GDP, particularly where one or two large establishments are sited in a small county. Profits do not benefit residents directly and are thus excluded from household income. The level of profits of individual establishments can also vary significantly from year to year and this can lead to significant year to year variation in GDP. A well known case is the sensitivity of the GDP of Dyfed to the level of profits of the several oil refineries in the county. Counties where the contribution of profits to GDP was relatively high in 1989 were Dyfed and Powys, Clwyd and Humberside. GDP per head in these counties tends to be higher relative to the UK average than household income.

Conversely there are a number of counties with relatively high levels of investment income, but relatively low profits. Examples of such counties are Surrey, Kent and some of the counties with relatively high proportions of retired people such as Dorset and West Sussex. Income per head in these counties tends to be higher relative to the UK average than GDP.

There are some counties where the differences between GDP and household income statistics in Table 8 cannot be explained by commuting or other factors, notably the Grampian region of Scotland. Work is continuing into explaining these differences (see technical note 16).

Technical notes

General

1. The regional accounts presented in this article are consistent with the national accounts published in the *United Kingdom National Accounts* 1991 edition, which also defines the terms used.

2. The methodology employed in producing the original items of the regional accounts was described in *Regional Accounts* (Studies in Official Statistics No 31) published in 1978 and updated in the publication methods used to compile regional accounts (Eurostat, 1984). Brief descriptions of the sources and methods used to compile the estimates of household income and government GDFCF by county and investment grants are given below. Information about changes in methodology is given in the technical notes to the articles appearing in *Economic Trends*.

Accuracy

3. As with the national accounts the estimates, although calculated as reliably as possible, cannot be regarded as accurate to the last digit shown.

4. The regional and county estimates are based partly on sample surveys and the quality of the results therefore varies according to sample size. This means that the results for areas with smaller populations such as the Isle of Wight and the Borders region of Scotland are subject to a greater degree of uncertainty than those for more populated areas. An assessment of the quality of regional and county estimates was published in *Economic Trends*, November 1990.

Provisional estimates

5. The estimates of personal and household incomes and consumers' expenditure given in this article for 1990 are based on a less complete set of data than estimates for earlier years and projections are employed where necessary. These provisional estimates are particularly subject to revision when more data for 1990 become available eg from the one per cent sample of pay records by the Department of Social Security and from the Survey of Personal Incomes.

Personal Income

6. Regional statistics of personal income and consumers' expenditure have been published annually since November 1976. Personal income is the income both actual and imputed of the personal sector, which comprises not only households, but also individuals living in hostels and other institutions, unincorporated businesses such as farms, the funds of pension and life assurance schemes, private trusts and all private non-profit making bodies: examples of these are universities, trade unions and charities. Personal disposable income is thus not a measure of the spending power of households.

7. The biggest component of personal income is income from employment. Other components include income from self employment and from rent, which are also components of GDP. Thus personal income and GDP tend to have similar regional distributions and show similar movements over time. Other

components are income from dividends and interest, from social security benefits and from other sources.

8. Personal disposable income is calculated by deducting taxes on income, social security contributions, community charge payments and current transfers from personal income. The deduction of the community charge has introduced a discontinuity into the national and regional estimates of personal disposable income. The community charge was introduced in Scotland in April 1989, but in April 1990 in England and Wales, and thus the first full calendar year of the community charge was 1990 in Scotland and 1991 in England and Wales. Domestic rates have been retained in Northern Ireland. The estimates of Scottish personal disposable income for 1989 and 1990 are not comparable with estimates either for previous years or for England, Wales and Northern Ireland and similarly, the 1990 estimates for England and Wales are not comparable with earlier figures or with those for Scotland or Northern Ireland. Amounts of community charge deducted from Scottish personal income in 1989, and Great Britain personal income in 1990 were £619 million and £8,811 million respectively.

Consumers' expenditure

9. Consumers' expenditure measures expenditure by households and private non-profit making bodies resident in a region. In accordance with national accounts definitions it includes imputed rent for owner-occupied dwellings rather than mortgage payments and the administrative costs of life assurance and superannuation schemes. Consumers' expenditure results are not directly comparable with household income (see technical note 12). There are no estimates of consumers' expenditure by county.

10. The consumers' expenditure estimates are based mainly on the Family Expenditure Survey (FES), supplemented by information from other sources e.g. on rent and education. The Family Expenditure Survey Handbook is an excellent source of information on the survey. The FES, like all surveys, is subject to both sampling and non-sampling errors. The data are smoothed to reduce the effect of sampling error using a centred moving average with a 1:2:1 weighting, but no adjustments are made for non-sampling error except that the FES data are grossed up using regional population estimates. Taking into account sampling and non-sampling error, the margin of error on the regional shares of consumers' expenditure is thought to range from 1.5 per cent in the South East to over 3 per cent in East Anglia. Recent estimates for Northern Ireland are thought to be more accurate than those for earlier years reflecting improvements to the selection of the sample.

11. The change from domestic rates to community charge has introduced a discontinuity into the national and regional estimates of consumers' expenditure. Domestic rates were treated as part of consumers' expenditure, but the community charge is treated as a deduction from income and is not included in consumers' expenditure. The community charge was introduced in Scotland in April 1989, but in April 1990 in England and Wales, and thus the first full calendar year of the community charge was 1990 in Scotland and 1991 in England and Wales. Thus the estimate of Scottish consumers expenditure for 1989 is not comparable with estimates either for previous years or for England, Wales and Northern Ireland and similarly, the 1990 estimates for England

and Wales are not comparable with earlier figures nor with those for Scotland or Northern Ireland. The amount of community charge not included in Scottish consumers' expenditure in 1989 was £619 million, and that in respect of Great Britain expenditure in 1990 was £8,811 million.

Household Income

12. The household sector is more narrowly defined than the personal sector as it includes only persons living in households and in institutions. The personal sector also includes the funds of pension and life assurance schemes and all private non-profit making bodies: examples of these are universities, trade unions and charities. Household income measures the income of the household sector and is not comparable with estimates of personal income and consumers' expenditure, which measure the income and expenditure of the whole of the personal sector.

13. The quality of the county estimates varies inversely with the population of the county. The margin of error in household income is thought to range from 2 to 6.5 per cent and in household disposable income from 3 to 8 per cent. These quality indicators are based on calculated sampling errors and a qualitative assessment of non-sampling errors. However non-sampling errors are difficult to assess. In particular income may be underestimated in counties where population growth is rapid. This is because addresses in the DSS 1% sample of National Insurance records held at Newcastle are not up to date. A fuller explanation was given in *Economic Trends* July 1989.

14. The estimates of household income may also understate income in areas with a very mobile population such as the oil-related population in Grampian and the Highlands and Islands. For Grampian there remains a substantial and unexplained difference between the estimates of employment income used here and those used in GDP, which are calculated using different source data: see technical note 16.

15. The community charge is not treated as a deduction from household income and there is thus no discontinuity in the estimates

of household disposable income for Scotland. There are however, discontinuities in consumers' expenditure and personal disposable income and these have been described earlier in the technical notes.

County GDP

16. County GDP estimates for 1989 were published in the regional accounts article in *Economic Trends*, November 1991. Comparisons of the income from employment component of GDP which is based on employment and earnings statistics, with estimates from the Newcastle National Income Statistics used for Household Income reveal a broad degree of agreement for nearly all areas. Estimates for the Highlands and Islands and Grampian regions of Scotland however show substantial differences which cannot be explained in terms of the conceptual differences. Following detailed comparisons of the sources, the estimates of GDP for all years for Highlands and Islands were revised downwards in the above article. Further work is required to resolve the differences in these data sources for Grampian.

Regional Trends

17. A wider range of statistics for the regions and counties of the United Kingdom can be found in *Regional Trends 1991*, (HMSO) price £23.00 net. The topics covered in *Regional Trends* include population, housing, transport and environment, health, law enforcement, education, employment, industry and agriculture.

The regional accounts database

18. This article necessarily presents only a summary of the regional accounts for recent years. Longer time series and in some cases additional detail can be made available on payment of a fee either on paper or on floppy disk. Requests should be addressed to the Regional Accounts Section, Central Statistical Office, PO Box 1333, Room 1817, Millbank Tower, Millbank, London SW1P 4QQ.

1. Community Charge replaced domestic rates in Scotland from 1989, and in England and Wales from 1990, while domestic rates continue in Northern Ireland. This introduces breaks in Great Britain regions' series. See technical note 8.

2. Provisional.

1. Excluding the Continental Shelf Region

2. Based on 1981 Census of population.

3. Men aged 65 and over, women aged 60 and over.

4. Gross Domestic Product for the Continental Shelf region does not include income from employment as this is allocated by the region of residence of the employee.

5. Estimates of GDP per head cannot be calculated for the Continental Shelf as there is no resident population for this region.

6. Surrey does not constitute a broadly self-contained labour market and so a meaningful unemployment rate cannot be provided for this county.

The Budget: 10 March 1992

The following are the proposed changes in taxation and national insurance as set out in the *Financial Statement and Budget Report 1992-93* (HMSO March 1992) (Price £9.65).

Income Tax

The rate of income tax will be reduced to 20 per cent for the first £2,000 of taxable income.

The personal allowance will be increased in line with the statutory indexation provisions (based on the increase of 4.5 per cent in the Retail Prices Index in the year to December 1991). So will the personal and married couple's allowances for those aged 65 and over. Other allowances, and the basic rate limit, will be unchanged. For 1992-93 the levels will be:

- personal allowance £3,445 (up £150);
- married couple's allowance, additional personal allowance and widow's bereavement allowance £1,720 (no change);
- for those aged 65 to 74: personal allowance £4,200 (up £180) and married couple's allowance £2,465 (up £110);
- for those aged 75 and over: personal allowance £4,370 (up £190) and married couple's allowance £2,505 (up £110);
- income limit for age-related allowances £14,200 (up £700);
- basic rate limit £23,700 (no change).

Married couples will be able to choose by agreement to give the married couple's allowance to the wife instead of the husband, or to share it equally between them, as from 1993-94. As an alternative, married women will be able to claim half the allowance at their own request.

Benefits-in-kind

The car benefit scale charges, used both for income tax and employers' national insurance contributions, will be increased by 4.5 per cent from 6 April 1992.

There will be a new, lower car fuel benefit scale for diesel cars. This will be used both for income tax and employers' national insurance contributions. The existing scales for assessing the benefit of employer-provided petrol will be increased by 4.5 per cent. The fuel scale charges for VAT will be similarly amended.

Charitable giving

The minimum limit for the Gift Aid scheme (tax relief on single charitable donations from close companies or individuals) will be reduced from £600 to £400 from 1 July 1992.

Savings

Savings of up to £6,000 a year, instead of £3,000 as at present, will be allowed in qualifying unit or investment trusts through a general Personal Equity Plan from 6 April 1992.

The capital gains tax annual exempt amount for 1992-93 will be increased in line with the statutory indexation provisions from £5,500 to £5,800 in the case of individuals and from £2,750 to £2,900 in the case of most trusts.

Business taxation

The limit of £8,000 on the cost of cars, above which capital allowances and tax relief for lease rental payments are restricted, will be raised to £12,000 from 11 March 1992.

The limit below which employers may pay PAYE/NIC quarterly rather than monthly will be raised from an average monthly bill of £400 to £450 for deductions made after 6 April 1992.

The Business Expansion Scheme will be abolished from the end of 1993, when relief for private rented housing expires. In the meantime the scheme will be amended to make it easier for companies to use the relief for mortgage rescue schemes.

Banks, brokers and other agents who deduct tax from payments of foreign dividends and interest will have to account for the tax which they deduct on a monthly basis from October 1992; the statutory remuneration to agents will be abolished.

Provisions will be introduced with effect from 10 March 1992 to prevent loss of tax through arrangements involving the payment of rent between connected persons.

Film expenditure

The tax treatment of film production costs will be amended for films completed after 10 March 1992. Production costs may be written off at a flat rate of 33 1/3 per cent starting on completion of the film. Pre-production costs incurred after 10 March 1992 will be written off as they are incurred.

Inheritance tax

Most business assets which currently qualify for 50 per cent relief from inheritance tax will be granted 100 per cent relief from 10 March 1992. Assets which currently qualify for 30 per cent relief will be granted 50 per cent relief.

The threshold for inheritance tax will be raised from £140,000 to £150,000 from 10 March 1992.

Tax appeals

Procedural rules will be introduced for appeal hearings. There will be powers to award costs where either party has acted wholly unreasonably, from 1 April 1993.

Car tax

Car tax will be halved from 10 per cent to 5 per cent of the wholesale price of new cars from 11 March 1992.

Excise duties

Most excise duties will rise from 6 pm on 10 March 1992.

The duties on alcoholic drinks will rise by 4.5 per cent, in line with the increase in the Retail Prices Index in the year to December 1991.

The duty on unleaded petrol and derv will rise by 4.5 per cent, in line with the increase in the Retail Prices Index in the year to December 1991.

The duty on leaded petrol will rise by 7.5 per cent.

The duty on cigarettes will rise by about 10 per cent, putting 13p on the price of a packet of 20 cigarettes. The duty on pipe tobacco will rise by 4.5 per cent and on other tobacco products by 10 per cent.

The rate of general betting duty will be cut from 8 per cent to 7.75 per cent from 1 April 1992.

Duties on matches and mechanical lighters will be abolished from 1 January 1993.

Members' clubs will be exempt from bingo duty from 3 August 1992.

Vehicle excise duties

Duty on cars, light vans and taxis will rise from £100 to £110 from 11 March 1992. Duty on lorries and most other vehicles will not change.

Value added tax

The registration threshold will rise from turnover of £35,000 to £36,600 from 11 March 1992, in line with the increase in the Retail Prices Index in the year to December 1991.

Traders who meet the other conditions for cash accounting (including annual turnover of £300,000 or less) will be able to join the scheme from 1 April 1992 even if they owe Customs and Excise up to £5,000, rather than a maximum of £1,000 as at present.

Large VAT payers will be required to make monthly payments on account from autumn 1992. They will not be required to make monthly returns and may continue to submit quarterly returns.

The rate of serious misdeclaration penalty will be cut from 20 per cent to 15 per cent on assessments calculated from 11 March 1992. Penalties will not normally be levied on under-declarations of £2,000 or less. The maximum rate of default surcharge will be cut from 30 per cent to 20 per cent from 1 April 1992.

Private taxi firms, self-drive hire firms and driving schools will be able to reclaim VAT paid on cars purchased for their businesses from 1 August 1992. They will be required to account for VAT on any private use of these cars and on their resale under the normal VAT rules.

VAT will no longer be charged on the salary forgone when employees are offered a choice between the private use of a company car or additional salary, from 1 April 1992.

Business rates

England and Wales

There will be amendments to the transitional arrangements for properties in England and Wales which face large changes in national non-domestic rate bills as a result of the 1990 reforms. These changes will reduce the total rates bill in England and Wales for 1992-93 by 3.25 per cent.

For 1992-93 only, rate bills for properties in transition to higher bills will not increase in real terms. Instead bills will increase by only 4.1 per cent, in line with the increase in the Retail Prices Index in the year to September 1991 used in setting the uprating of business poundages already announced in November 1991.

New occupiers will be able to inherit the transitional relief due to the previous occupier, from 11 March 1992.

For properties in transition to lower rate bills, the maximum reduction in rate bills in real terms for 1992-93 will be 22 per cent for large properties and 27 per cent for smaller properties. This is 9 percentage points higher in each case than in 1991-92. All properties gaining from the 1990 reforms will benefit from fully reduced bills from 1993-94.

Scotland and Northern Ireland

Scotland and Northern Ireland have different arrangements for business rates but their total rates bills for 1992-93 will also be reduced by 3.25 per cent.

ANNEX

How the figures have been calculated

This table gives the direct effects on receipts of changes in taxation and national insurance. Estimates are rounded to the nearest £5 million. "Negligible" means less than £3 million. Measures are costed in the order in which they appear in the table.

The direct effect of a tax change is the difference between the yield of tax which would arise on the basis of the rates of tax, allowances, etc prevailing before the Budget (the pre-Budget regime) and the yield after the changes proposed in the Budget (the post-Budget regime). The difference in yield is generally calculated by applying the pre- and post-Budget regimes to the same tax base. This base is the post-Budget base - that is, the levels of income, consumption, profits, etc forecast for future years on the assumption that all the measures proposed in the Budget take effect.

Thus the direct effects are estimated subject to the constraint that, in general, total incomes and total expenditure are fixed at their post-Budget levels. In other words the estimates in the table do not include income effects - that is, effects arising solely from the impact of changes in taxes on disposable income. Nor do they include the effects of changes in the tax base arising from changes in pre-tax incomes, the general level of prices or other macro-economic variables which may result from the proposed tax changes.

Other behavioural effects are taken into account where it is thought that they will have a significant effect on the yield, for example tax changes which alter the allocation of savings between different financial instruments or affect the composition of expenditure. Some change between the pre- and post-Budget tax base is thus implicitly allowed for in these cases, subject to the overall constraint on total incomes and expenditure outlined above.

For Customs and Excise taxes and duties, all the estimates of yield incorporate the effects of the tax changes on relative prices and associated changes in the pattern of consumers' expenditure. Aggregate income and consumers' expenditure at factor cost are assumed not to change. Behavioural effects are taken into account for Inland Revenue taxes for changes involving the take-up of a new or modified relief.

Most of the figures for direct effects shown in the table represent the change in the yield of the tax in question. Where appropriate, however, the effects on the yield of other taxes are also incorporated. For example, the direct effect of a change in the excise duties on tobacco incorporates, in addition to the change in the yield from tobacco duties, the change in the yield of VAT and other excise duties resulting from changes in the composition of consumers' expenditure. As a general rule, only repercussions on the yield of other taxes of the same type are allowed for, such as other taxes on expenditure in the case of tobacco duties but not taxes on income or profits.

The figures in the first column of the table show the direct effect of the Budget proposals on receipts in 1992-93. Budget proposals are compared with a non-indexed base - that is, with the pre-Budget regime of allowances, thresholds and rates of duty at 1991-92 levels

The figures in the second column show the direct effect of the Budget proposals on receipts in 1992-93 measured against an indexed base. The indexed base for 1992-93 is obtained by increasing allowances, thresholds and rates of duty in line with the increase in the RPI over the year to December 1991 (4.5 per cent).

The figures in the third column show the direct effect on receipts in 1993-94, also measured against an indexed base. For this comparison, both the Budget proposals and the indexed base for 1992-93 have been further indexed by the forecast movement in the RPI between the fourth quarters of 1991 and 1992 (shown in Table 3.1).

The following notes refer by number to individual line entries in the tables and to appropriate sections in the main Budget article.

Income tax

1-5 and 7 See 'income tax' paragraph 1 in main article.

6 See 'income tax' paragraph 1 in main article. The cost in 1993-94 includes the effects of statutory indexation of the lower rate limit for 1993-94. There is also a public expenditure cost of £30 million in 1992-93 and £35 million in 1993-94 in respect of mortgage interest relief at 25 per cent for those liable to tax only at the new lower rate. This will be charged to the Reserve.

8 From April 1993 married couples will, by agreement, be able to choose to set all of the married couple's allowance against the wife's instead of the husband's income, or to share it equally. Alternatively, married women will be able to choose to set half of the married couple's allowance against their own income instead of their husband's. If none of these options is taken, the allowance will be given to the husband, as now. The cost of £10 million is based on the assumption that couples will choose to set the allowance against the wife's income where she is a higher rate taxpayer and he is not, thus reducing the couple's total tax liability.

9-11 See 'benefits-in-kind' paragraphs of main article. The effect of the changes in car and fuel benefit scales on employers' national insurance contributions is at line 66 in the table. The effect of the similar change to VAT fuel scales is at line 40 in the table.

12 The rules for tax relief on maintenance payments will be changed to take account of the establishment of the Child Support Agency in 1993.

13 The tax rules governing certificates of deposit will be amended to enable paperless, or "dematerialised", certificates of deposit to be treated in the same way as paper certificates.

14 The current rules which require payers of dividends to forward vouchers to the payee along with the payment itself will be updated to take account of changes in the handling of dividend payments and in particular electronic transfer.

15 The provisions governing the making of returns on interest paid to non-residents will be brought into line with those on the deduction of tax from this interest.

16 See 'business taxation', paragraph 4 of main article. The abolition of the statutory remuneration to paying and collecting agents will give a public expenditure saving of some £1 1/2 million a year.

17 See 'business taxation', paragraph 2 of main article. This line shows the effect on income tax receipts. The effect on receipts of national insurance contributions is at line 67 in the table.

Income tax and corporation tax

18 See 'business taxation', paragraph 1 of main article. The cost of relaxing the restrictions on capital allowances for most business cars is expected to rise to a maximum of £220 million in later years.

19 Capital expenditure on computer software acquired under licence will qualify for 25 per cent plant and machinery capital allowances from 10 March 1992, bringing it into line with computer software acquired outright.

20 See 'film expenditure' paragraph in main article.

21 With effect from 10 March 1992 where rent for a chargeable period is payable in arrear between connected persons, and the rent is an allowable expense of the payer, the recipient of the rent will be chargeable to tax on the rent which accrued in that period. The yield arises from the change in the basis of liability to tax on rent payable under existing arrangements; a further yield of £100 million is expected in 1994-95. Without this measure there could be a significant loss of tax in the future.

22 Insolvent former deposit takers which have ceased trading and are in compulsory liquidation will be allowed relief, against income arising from their former trade, for losses carried forward and for certain expenses. Relief will apply for chargeable periods ending after 10 March 1991.

23 See 'charitable giving' paragraphs in main article.

24 The rules for tax relief for charitable covenants will be amended so that a power to terminate a covenant will be ignored until it is exercised, provided that it cannot be exercised within the minimum period.

25 The power to inspect charities' records of donations under the Gift Aid scheme will be extended to cover other income on which charities claim tax repayments.

26 The 1992 Friendly Societies Bill, when enacted, will enable registered friendly societies to incorporate, form subsidiaries and generally extend the scope of the financial services they can provide. The Budget measures will eliminate the tax charges which would otherwise arise on incorporation, and which would act as a disincentive to incorporation. They will also extend to incorporated societies the limited tax exemptions which apply to registered societies.

Income tax and capital gains tax

27 With effect from 6 April 1992 it will be possible to subscribe up to £6,000 a year to a general PEP in investment or unit trusts with at least half of their holdings in EC equities. The cost of this measure is expected to rise in later years.

28 See 'business taxation', paragraphs 3 of main article. Some technical changes concerning property management subsidiaries will also be made.

29 See 'business taxation', paragraph 3 of main article. The relief on private rented housing was already due to expire at the end of 1993. The saving in later years from also abolishing relief for trading companies is £15 million. In 1994-95 there will be some extra cost as a result of acceleration of investment to 1993-94. The total saving from the abolition of all reliefs under the Business Expansion Scheme will be £130 million in later years.

30 The maximum level of earnings for which pension provision may be made with tax relief under the Finance Act 1989 will be increased. It will rise to £75,000 in line with the statutory indexation provisions (based on the increase of 4.5 per cent in the Retail Prices Index in the year to December 1991).

Capital gains tax

31 See 'savings' paragraph 2 of main article. The estimated full year cost of indexation of the capital gains tax annual exempt amount in respect of 1992-93 liabilities is £5 million.

Inheritance tax

32 See 'inheritance tax' paragraph 2 of main article. The estimated full year cost of the increase in the inheritance tax threshold attributable to taxable estates in 1992-93 is £25 million, measured against an indexed base.

33 The new 100 per cent rate of business and agricultural relief will apply to business assets and farmlands that currently qualify for 50 per cent relief with two changes. It will be extended to holdings of more than 25 per cent without control in Unlisted Securities Market (USM) companies. But controlling holdings in fully quoted companies will continue to receive 50 per cent relief. 50 per cent relief will also apply to business assets and farmland that currently qualify for 30 per cent relief and to holdings of 25 per cent or less without control in USM companies. These changes to business and agricultural relief will take effect from 10 March 1992. The estimated full year cost of these changes attributable to transfers in 1992-93 is £55 million.

Tax appeals

34 Procedural rules for hearing tax appeals, including powers for the Special Commissioners to award costs where either party has acted wholly unreasonably in pursuing an appeal, will be introduced. The new rules will not come into effect before 1 April 1993.

Value added tax

35 The turnover threshold for VAT registration will be raised from £35,000 to £36,600 from 11 March 1992, and the deregistration threshold from £33,600 to £35,100 from 1 May 1992.

36 See 'Value added tax, paragraph 3 of main article. There is a cost to this measure because the once-off cashflow gain from the system of monthly payments on account will be less than that from the system of monthly returns which had been announced. The main reason is that the size of payments on account will be determined by past, not present, VAT payments.

37 See 'Value added tax' paragraph 4 of main article.

38 See 'Value added tax' paragraph 5 of main article.

39 See 'Value added tax' paragraph 6 of main article.

40 See 'benefits in kind' paragraph 2 of main article.

41 From 1 April 1992 VAT relief for charities and the disabled will be extended to boats built or substantially adapted for use by handicapped people; the provision of special toilet facilities for handicapped people in charity-run buildings used for charitable purposes; repairs and maintenance of equipment used for talking books for blind people; and replacement engines, spare parts and accessories for lifeboats.

42 See 'Value added tax' paragraph 2 of main article.

43 The wording of the VAT law regarding supplies made for a non-monetary consideration will be revised to bring the provision into line with the relevant European Community directive. No change in practice is involved.

44 Certain supplies made for no consideration (such as obsolete computer equipment donated to educational establishments) will be valued for VAT purposes at their current value rather than their original cost, after Royal Assent to the Finance Bill.

Car tax

45 See 'car tax' paragraph of main article.

Excise duties

46 The increase in duty plus VAT is equivalent to about 1p on a pint of beer.

47 The increase in duty plus VAT is equivalent to about 5p on a 75cl bottle of still wine, about 8p on a 75cl bottle of sparkling wine, about 8p on a 70cl bottle of sherry and about 10p on a 75cl bottle of port.

48 The increase in duty plus VAT is equivalent to about 28p on a 70cl bottle of spirits.

49 The increase in duty plus VAT is equivalent to about 1p on a pint of cider or perry.

50 The increase in duty plus VAT is equivalent to 1.2p on a litre of unleaded petrol. The tax differential in favour of unleaded petrol will consequently rise from 4.0p to 5.1p a litre.

51 The increase in duty plus VAT is equivalent to 1.2p on a litre of derv.

52 The duty on gas oil and fuel oil will rise by 4.5 per cent, equivalent to about 0.06p and 0.04p respectively a litre. (Gas oil and fuel oil supplied to domestic users are zero-rated for VAT.)

53 The increase in duty plus VAT is equivalent to 2.3p on a litre of leaded petrol.

54 The increase in duty plus VAT is equivalent to 13p on a packet of 20 cigarettes.

55 The increase in duty plus VAT is equivalent to about 6p on a packet of five small cigars and about 38p on a 50 gram packet of hand-rolling tobacco.

56 The increase in duty plus VAT is equivalent to about 8p on a 50 gram packet of pipe tobacco.

57 See 'excise duties' paragraph 6 of main article.

58 See 'excise duties' paragraph 7 of main article.

59 See 'excise duties' paragraph 8 of main article.

Vehicle excise duty

60 The duty on vehicles registered in the private and light goods class, and the duty on taxis, will increase to £110, from 11 March 1992.

61 Three new VED classes for lorries will be introduced from 1 January 1993, to deal with vehicles that will be able to operate in the UK from that date. The rate for the heaviest lorry will be £5,000.

62 A new VED rate of £15 will be introduced for small motorized tricycles with an engine capacity of under 150cc, from 11 March 1992.

63 All other VED rates will remain unchanged.

64 The arrangements for charging fees for special vehicle registration marks will be reformed, to enable a charge to be made when a mark is not transferred to a vehicle within 12 months of it having been reserved.

Business rates

65 See 'business rates' paragraphs of main article.

National insurance contributions

66 See 'benefits in kind' paragraphs in the main article. This line shows the consequential effects on national insurance receipts. The effects on income tax receipts are at lines 9-11 in the table.

67 See 'business taxation' paragraph 2 in the main article. This line shows the effect on national insurance receipts. The effect on income tax receipts is at line 17 in the table.

The Economy: recent developments and prospects to mid-1993

The following notes and tables are taken from the *Financial Statement and Budget Report 1992-93* (HMSO March 1992) (Price £9.65).

Summary

Inflation

Inflation has fallen sharply over the past year. RPI inflation was 4 per cent in January compared with 9 per cent a year earlier. Producer output price inflation (excluding food, drink and tobacco) fell to 2 $\frac{3}{4}$ per cent in February. RPI inflation may rise slightly in the next few months, as the effects of last year's Budget and mortgage rate cuts drop out. But it is forecast to fall back to 3 $\frac{3}{4}$ per cent by the fourth quarter, and to 3 $\frac{1}{4}$ per cent by the second quarter of 1993. Underlying inflation should continue to fall steadily with producer price inflation expected to fall to 1 $\frac{1}{2}$ per cent by mid-1993.

Demand and activity

The level of GDP stabilised in the second half of 1991, but signs of recovery evident in the summer and early autumn were not sustained. GDP fell by nearly 2 $\frac{1}{2}$ per cent in 1991 as a whole. Activity is expected to recover through 1992 as consumers' expenditure and exports pick up and destocking comes to an end. GDP is forecast to rise by 1 per cent in 1992, but by 2 per cent in the year to the second half.

Labour market

The rate of increase of unemployment fell sharply through 1991, though progress has slowed in recent months. Unemployment may continue rising for a while yet, though at a slower rate.

Current account

The current account deficit is forecast to rise from £4 $\frac{1}{2}$ billion in 1991 to £6 $\frac{1}{2}$ billion in 1992, as domestic demand recovers and invisibles lose the benefit of Gulf contributions and unusually low net EC contributions in 1991.

Financial developments

Since sterling joined the ERM, UK interest rates have fallen, narrowing sharply the differential with rates in the low inflation ERM countries. M0 was within its target range for the whole of the last year and in the upper half of its range since September.

Public finances

The PSBR is forecast to be £13 $\frac{3}{4}$ billion in 1991-92 and £28 billion in 1992-93.

World economy

Signs of recovery in the world economy faded towards the end of last year and growth in the major seven economies in 1991 is now estimated at 1 per cent, the lowest since 1982. GDP in the G7 is expected to rise by 1 $\frac{1}{2}$ per cent in 1992, with growth picking up through the year. Inflation is forecast to be 3 per cent by the end of the year.

Recent developments

Growth in the G7 economies remained very subdued in the closing months of 1991, with few signs of the recovery expected at the time of the Autumn Statement. The US economy started to recover in the spring, but by the end of the year growth had again slowed. In the second half of last year western Germany registered a fall in output and growth in Japan slowed sharply. For the G7 as a whole, GDP is estimated to have grown by around 1 per cent in 1991, the weakest performance since 1982.

Industrial production in the G7 countries rose in the summer but stalled in the autumn. There were renewed signs of weakness in most G7 countries around the turn of the year. Business and consumer confidence indicators have fallen sharply in recent months in Japan and Germany. In the US, business confidence improved significantly in February, but consumer confidence was at its lowest since 1974.

The very slow growth and increasing levels of spare capacity in almost all G7 countries have placed continued downward pressure on inflation. In the fourth quarter of 1991 consumer price inflation averaged 3 $\frac{1}{2}$ per cent in G7 countries, compared with 5 $\frac{1}{2}$ per cent a year earlier. There were particularly large reductions in the US and Canada, as well as the UK. Against the trend, German inflation rose to a little over 4 per cent in the latest three months, compared with 3 per cent a year earlier. The generally good inflation performance has been helped by continuing weakness of commodity prices, in particular of metals, which have been affected by increased exports to the west from the former Soviet Union.

Outside Europe the easing of inflationary pressures has allowed short term interest rates to fall further, by over 1 percentage point since October in the US and Japan. In the US the discount rate is now at its lowest since 1964. In Europe interest rates remain high. Official rates rose in December in all ERM countries except the UK, following the rise in German rates. Government deficits widened in most G7 countries in 1991. Outside Germany this mainly reflected the effects of automatic stabilisers.

The US current account moved back into small deficit in the second half of 1991, following the exceptional surplus in the first half, which was entirely accounted for by Gulf war burden-sharing contributions. The Japanese surplus in 1991 was \$73 billion, 2 $\frac{1}{4}$ per cent of GNP and the highest since 1988. The German current account remained in small deficit throughout the year.

Forecast

Against a background of falling inflation, lower interest rates outside Europe and widening fiscal deficits, a recovery in output is forecast this year. GDP growth in the G7 is forecast to be 1 $\frac{1}{2}$ per cent in 1992. It is expected to be stronger in the second half than the first, especially in the US and Germany. In the first half of 1993 G7 GDP growth is forecast to be 2 $\frac{3}{4}$ per cent, about the same as the average between 1979 and 1989, the last two cyclical peaks.

This forecast represents a muted recovery by past standards. This partly reflects the comparatively slow recovery forecast for the US, where high levels of personal and corporate indebtedness and an historically low saving ratio make it unlikely that the rapid growth rates typical of previous recoveries will be repeated. US growth is forecast to be about 2 per cent by the end of this year, after a slow first half. A recovery in real incomes, especially in the second half of the year, is the main factor lying behind this pick-up. US exports are forecast to continue to perform well, benefiting from the lagged effects of a weak dollar.

Table 1 World economy

	Percentage changes on a year earlier			
	1990	Estimate 1991	Forecast 1992	1993 H1
<i>Major seven countries¹</i>				
Real GDP	2½	1	1½	2¾
Domestic demand	2¼	¼	1½	2¾
Industrial production	1¾	- ½	¾	3¼
Consumer prices ²	5½	3½	3	3
<i>World trade volumes</i>				
Total imports	4¼	1¼	3¾	5½
Trade in manufactures ³	4¾	1¾	4	6¼

¹ US, Japan, western Germany, France, UK, Italy and Canada.

² Final quarter of each period.

³ Trade in manufactures is based on a UN series for market economies and therefore excludes exports from former centrally planned economies.

Only sluggish growth is forecast in the three main continental European economies this year, averaging about 1¼ per cent. Growth in Germany will be rather less than this, but will be helped by the removal of the temporary income tax surcharge in July 1992. However, 1993 looks like being a better year for these countries, particularly Germany.

Non-oil commodity prices are forecast to remain around present levels in real terms. Oil prices have fallen since the autumn, reflecting weak demand and changing views about the prospects for supplies from Kuwait, Iraq and the former Soviet Union. The recent OPEC agreement is unlikely to lead to a significant change in prices. Brent is assumed to average \$18 a barrel, close to recent levels.

With activity forecast to remain below trend, and a favourable outlook for commodity prices, downward pressure on inflation is expected to continue. G7 consumer price inflation is forecast to be about 3 per cent by the end of the year, remaining little changed in the first half of 1993. After reaching a peak in the spring, German inflation is forecast to fall back, dropping sharply in July as last year's oil tax rise drops out of the year-on-year calculation. However, it will pick up again at the beginning of 1993 if the proposed 1 point rise in the VAT rate is introduced.

Subdued growth in all the G7 countries makes it unlikely that there will be large changes in current accounts. The US deficit is forecast to widen, but this largely reflects the one-off nature of the Gulf war burden-sharing contributions in 1991. For Japan much of the rise in the current account surplus last year can be attributed to improvements in the terms of trade. No repeat of this is forecast, and the current account surplus is therefore expected to remain around 2 per cent of GNP.

Latest information suggests that the growth of total world trade in 1991 was 1¼ per cent. The collapse of trade both to and from the economies of eastern Europe and the former Soviet Union contributed to the slow recorded growth in 1991. Growth of total world trade is forecast to pick up to 3¾ per cent in 1992. It is not until 1993 that growth again approaches the average for the second half of the 1980s. World trade in manufactures follows a similar pattern.

UK demand and output

GDP levelled out in the second half of 1991; in the fourth quarter it was much the same as in the second quarter. But signs of recovery last summer and early autumn were not sustained. GDP fell by nearly 2½ per cent in 1991 as a whole. Non-oil GDP continued to decline through last year, though at a moderating pace. By the fourth quarter it was 3¾ per cent below its peak in the second quarter of 1990.

The failure of the recovery to take hold in the second half of 1991 was part of a pattern of weakening activity in most of the major countries. Similar factors may have been at work in a number of countries, and may have been mutually reinforcing, resulting in a general deterioration in confidence. In the UK this partly reversed the large improvement in business and consumer confidence seen earlier in the year. Weaker activity in the rest of the world meant that exports were lower than they would otherwise have been. And domestic demand remained subdued, as consumers and businesses sought further improvements in their financial position. Despite signs of a pick-up in retail sales around the middle of the year, the expected recovery in consumers' expenditure did not materialise. And although manufacturing investment levelled out, total business investment continued to fall. Domestic demand fell by 1¼ per cent between the first and second halves, and by 3 per cent in 1991 as a whole.

Within GDP, the output of the service sector continued to fall in the second half of 1991, though at a slower rate. Energy output rose in the third and fourth quarters, as oil output recovered from the effects of safety-related maintenance work which depressed output earlier in the year. However, manufacturing output, after levelling out in mid-year, fell by a further 1¼ per cent in the fourth quarter, and by 5¼ per cent in 1991 as a whole. This is consistent with CBI survey evidence which showed a steady improvement in manufacturers' output expectations until the autumn, but some deterioration since then, once it became clear that the recovery had not become established.

Nevertheless the forces making for recovery are still in place, including the continuing effects of lower interest rates, falling inflation and the automatic fiscal stabilisers. And consumer and business confidence, though lower than in the autumn, remain well above the levels of a year ago. Although growth may be slow at first it should gather pace through the year, as consumer spending picks up, recovery in the world economy boosts exports, and destocking comes to an end. GDP is forecast to rise by 1 per cent in 1992, but by nearly 2 per cent in the year to the second half, and by 3 per cent in the year to the first half of 1993. The pace of the recovery is expected to be about the same as that following the previous two recessions. Manufacturing output may rise by only ½ per cent in 1992, but is forecast to rise more rapidly than GDP from mid-1992 onwards.

Personal sector

Consumers' expenditure flattened off in the second half of 1991, having fallen by 2¾ per cent in the year to the second quarter. The saving ratio rose sharply through 1990 and levelled off in 1991 at around 10 per cent, historically high for a period of low inflation. Housing investment has also been cut back sharply. The personal sector has therefore moved from substantial financial deficit in 1988 to an estimated surplus of £17½ billion, over 4 per cent of income, in 1991.

A number of factors should help to increase consumer spending. Real personal disposable income, down ¾ per cent in 1991, is forecast to rise by a similar amount in 1992. The 4½ point reduction in interest rates since October 1990, and the halving of the inflation rate last year, have yet to have their full effect. And although personal wealth has fallen, largely because of lower house prices, it remains high by all but the standards of the late 1980s. There is scope for the saving ratio to fall back from its current high level without damaging personal sector balance sheets, but the forecast assumes only a modest fall, to 9½ per cent by the first half of 1993.

These positive influences may be offset to some extent by the effects of continuing weakness in the housing market - any recovery here during 1992 is likely to be slow - and by high levels

of debt. The rise in the debt-income ratio in the late 1980s was unprecedented, and past relationships provide little guide to how far consumers might now want to retrench. However, a sharp deceleration of personal borrowing stabilised the debt-income ratio in 1991, and some fall is possible during 1992. Lower interest rates mean that the costs of servicing debt have already fallen sharply. As a result, real disposable income for a typical family with a £30,000 mortgage has risen by over 15 per cent since October 1990.

Consumers' expenditure is forecast to rise by 1 per cent in 1992, though the initial pick-up could be slow and the precise timing is uncertain. It is forecast to rise by $1\frac{3}{4}$ per cent in the year to the second half of 1992 and by 3 per cent in the year to the first half of 1993. Housing investment is likely to remain weak for a while before picking up later this year. The personal sector is expected to remain in substantial financial surplus.

Company expenditure and income

Business investment peaked at record levels in early 1990 but has since fallen as companies have sought to improve their financial position against a backdrop of falling incomes. Business investment fell by $11\frac{3}{4}$ per cent in 1991.

If investment bears its usual relation to the cycle, it may continue to decline for a short time after output has begun to rise, though the fall forecast for 1992 is much less than that seen in 1991. This is consistent with the message from recent business surveys. The CBI balances for optimism and investment intentions have weakened since the Autumn Statement but remain well above their troughs of a year ago.

Even at its trough in 1992, the ratio of business investment to GDP is forecast to be higher than in any year during the 1970s and the first half of the 1980s, a consequence of the record growth rates seen in the late 1980s. With profitability increasing and the recovery becoming well established, business investment is forecast to rise by 3 per cent in the year to the first half of 1993. And the conditions should be in place for stronger growth thereafter.

Government investment

General government investment fell by $9\frac{1}{4}$ per cent in 1991, but is forecast to rise by $10\frac{3}{4}$ per cent in 1992. The year-on-year growth rates have been distorted by fluctuations in the quarterly pattern of local authority investment, and by the surge in local authority investment at the beginning of 1990 as authorities forestalled the new capital control regime introduced in April of that year. The forecast level of general government investment in 1992 is 24 per cent higher than that in 1988 and 50 per cent higher than in 1979.

Table 2 Gross domestic fixed capital formation at constant prices

	Percentage changes on a year earlier			
	Weights in 1991	1991	Forecast 1992	1993 H1
Business ¹	69	-11 $\frac{3}{4}$	-2 $\frac{3}{4}$	3
Private dwellings ²	16	-3 $\frac{1}{4}$	-1 $\frac{3}{4}$	4
General government ³	15	-9 $\frac{1}{4}$	10 $\frac{3}{4}$	4 $\frac{1}{4}$
Total fixed investment	100	-10 $\frac{1}{4}$	-1 $\frac{1}{2}$	3 $\frac{1}{2}$

¹ Includes public corporations.

² Includes purchases less sales of land and existing buildings for the whole economy.

³ Excludes purchases less sales of land and existing buildings.

Stockbuilding

Preliminary indications for 1991 suggest that companies continued to cut their stock levels in response to their difficult financial position. But the rate of destocking has eased, and this trend is

forecast to continue in 1992. As a result, while stock levels may continue to fall through much of 1992, stockbuilding is forecast to make a positive contribution to growth. Companies may begin to build up stocks from late 1992 to keep pace with rising sales and output. The change in stockbuilding could add 1 per cent to GDP growth in the year to the first half of 1993.

Companies' financial position

Industrial and commercial companies' profits (net of stock appreciation) are estimated to have fallen by $1\frac{3}{4}$ per cent in 1991. But with a sharp fall in outlays, company saving rose a little. Together with the decline in capital expenditure this led to a halving of the financial deficit in 1991. Adjustment is forecast to continue in 1992, aided by a recovery in profits. By the first half of 1993 industrial and commercial companies could be close to financial balance.

Employment and unemployment

Companies have reduced employment more quickly relative to output in this recession than in previous downturns. This no doubt reflects their determination to keep costs under control to maintain competitiveness, now that sterling is in the ERM. As a result, productivity has held up better this time than in previous post-war recessions. In the manufacturing sector, productivity rose by $2\frac{3}{4}$ per cent in the year to the fourth quarter of 1991. It is now close to its all time high, even though output is 8 per cent below its peak in the second quarter of 1990. Productivity growth is expected to gather pace in 1992.

Latest data indicate that employment has fallen by 1 million from its record level in June 1990. It is likely to continue to fall for a while yet, though at a moderating pace. The upward trend in unemployment abated sharply in the course of 1991, much as expected. The trend monthly increase in unemployment levelled off around the turn of the year but is likely to moderate further in the months ahead as activity picks up.

Trade and the balance of payments

The current account deficit in 1991 is estimated to have been £4 $\frac{1}{2}$ billion, sharply down from the £15 $\frac{1}{2}$ billion deficit recorded for 1990. The visible deficit nearly halved from £18 $\frac{1}{2}$ billion in 1990 to £10 billion in 1991. Exports reached record levels during the year and low domestic demand held imports down. The surplus on invisibles rose sharply to £5 $\frac{1}{2}$ billion in 1991 from £3 billion in 1990, thanks to Gulf receipts and unusually low net EC contributions.

Competitiveness

Unit labour costs grew much faster in the UK than elsewhere during 1990, and cost competitiveness continued to weaken in early 1991. Since then it has been improving. Price competitiveness deteriorated less than cost competitiveness in 1990 and had already started to improve by the end of the year as UK exporters cut their margins sharply.

Over the forecast period UK competitiveness is expected to improve, with manufacturing unit labour costs growing less quickly here than in the other main manufacturing countries. UK manufacturing unit labour cost growth has already fallen to under $4\frac{1}{2}$ per cent from a peak of around 11 per cent. It is expected to slow further in 1992 and to fall in the first half of 1993, reflecting both the slowdown in earnings growth and the pick-up in productivity.

Non-oil trade

The volume of exports of manufactures increased by $3\frac{1}{4}$ per cent in 1991. While this was only around half as fast as in 1990, it nevertheless represents a strong performance when set against estimated world trade growth of manufactures of $1\frac{3}{4}$ per cent.

The UK's share of world trade in manufactures is estimated to have risen in 1991 for the third year running. It may be that firms switched into exports in the face of weak domestic demand. But there also appears to have been an improvement in underlying performance. The favourable trend in competitiveness should keep the share rising in the medium term, though it may be broadly unchanged in 1992 before picking up again in the first half of 1993. Manufactured exports could be $6\frac{3}{4}$ per cent higher at the end of 1992 than a year earlier, and 4 per cent higher in 1992 as a whole.

Imports of non-oil goods fell by 3 per cent in volume terms in 1991 following a near standstill in 1990. Nevertheless imports were on a rising trend during the year. The low figure for 1991 as a whole was the consequence of low domestic demand; the upward trend during the year, which was mainly accounted for by imports of basic materials and capital goods, was perhaps a sign that firms were preparing for the recovery.

Non-oil import volumes could rise by $4\frac{3}{4}$ per cent overall in 1992. The growth is likely to be uneven - slow in the first half, faster in the second - in line with the projected pattern of demand. Import penetration is likely to continue to rise, but modestly by past standards thanks to the favourable trend in UK competitiveness. The trend in import penetration has been upward for many years in the UK as elsewhere because of the effect on trade patterns of increasing specialisation of world production.

Trade prices

The current account in 1991 benefited from an improvement in the non-oil terms of trade. While export prices were hardly changed, import prices fell by $2\frac{3}{4}$ per cent. Export and import prices are expected to change little in 1992.

Table 3 Visible trade volumes

	Percentage changes on a year earlier					
	Non-oil goods		Oil		All goods

1990	$6\frac{1}{2}$	$\frac{1}{4}$	$9\frac{1}{2}$	12	$6\frac{3}{4}$	$1\frac{1}{4}$
1991	$2\frac{1}{2}$	-3	-4	$-3\frac{1}{4}$	$1\frac{3}{4}$	$-2\frac{3}{4}$
1992 forecast	$3\frac{3}{4}$	$4\frac{3}{4}$	$6\frac{3}{4}$	3	$4\frac{1}{4}$	$4\frac{3}{4}$

Oil production and trade

North Sea oil production recovered sharply in the second half of 1991, following the extended shutdowns for safety work which depressed output in 1990 and the first half of 1991. It is expected to remain around this higher level in 1992, with oil production about 6 per cent up on 1991 and close to the centre of the Department of Energy's Brown Book range.

In 1992 oil prices are assumed to be close to recent levels, nearly 10 per cent lower than last year. But because production is forecast to be higher than last year, the surplus on trade in oil is expected to rise to around $\pounds 1\frac{1}{2}$ billion.

Invisibles and net overseas assets

The surplus on invisibles in 1991 turned out a good deal higher than expected at the time of the Autumn Statement, largely because of significant upward revisions to the balance of interest, profits and dividends (IPD). But even after the revisions, the balance of IPD was only $\pounds 1\frac{1}{2}$ billion in 1991, down from $\pounds 3$ billion in 1990. The low figure was in part accounted for by oil companies' stock losses as oil prices fell from their peak during the Gulf crisis. But unusually low net government transfers offset the effect of this on the invisibles balance. The low transfers were due to lower than usual net payments to the EC and large one-off receipts from overseas governments related to the Gulf war. As

Because the special factors boosting the balance of transfers in 1991 will not be repeated, the invisibles balance is projected to fall back to around $\pounds 4\frac{1}{2}$ billion in 1992, from $\pounds 5\frac{1}{2}$ billion in 1991. But the underlying trend is improving. The balance of services is forecast to rise in 1992. IPD should recover from the low 1991 level as the oil price falls of 1991 are assumed not to recur.

Net overseas assets are estimated to have risen to around $\pounds 37$ billion at the end of 1991 from around $\pounds 20$ billion at the end of 1990. As the current account was in deficit, this rise is more than accounted for by revaluations, mainly reflecting movements in world stock markets. But some capital flows are difficult to measure, and the outstanding stock of assets is difficult to value, which means that estimates of net overseas assets must be interpreted with considerable caution.

Current account

The current account deficit is expected to widen to $\pounds 6\frac{1}{2}$ billion in 1992 from $\pounds 4\frac{1}{2}$ billion in 1991. The fall in the invisibles surplus accounts for half the increase as the special factors in 1991 unwind. Although the deficit on manufactures rises by $\pounds 1\frac{1}{2}$ billion, the trade performance of the manufacturing sector is nevertheless expected to be strong. This deterioration is relatively gentle given expected world trade and domestic demand growth, because of the improved competitive position of UK industry.

¹ Figures in brackets are as a percent of GDP.

Financial balances and the current account

Over the period 1988-1990, the private sector's financial position deteriorated sharply as spending outstripped income. The deficits were without precedent in the last seventy years. The position was unsustainable and a correction was inevitable; the private sector reduced its deficit in 1990 and moved into modest surplus in 1991.

The surplus is forecast to increase in 1992 and the first half of 1993 to levels which, as a percent of GDP, would be comparable with those of the first half of the 1980s. Both companies and persons contributed to the improvement in the private sector's financial position in 1991, and the pattern in 1992 is expected to be much the same.

The large current account deficits of 1988-1990 were the counterpart of the unprecedentedly large private sector financial deficits. The move of the private sector back into surplus is reflected in lower current account deficits.

Inflation

Producer output price inflation (excluding food, drink and tobacco) has continued to fall in recent months, to $2\frac{3}{4}$ per cent in February - the lowest rate since 1969 - compared with $6\frac{1}{2}$ per cent early last year. The annualised rate in the latest three months on the previous three months is now down to $2\frac{1}{4}$ per cent. Although unit labour cost growth is well down on a year earlier, profit margins remain under pressure.

Retail price inflation has also fallen substantially, to 4 per cent in January compared with 9 per cent a year earlier. The all-items

rate has fluctuated over the last few months as the effects of changes in mortgage rates and oil prices in late 1990 have dropped out of the calculation. Excluding these, the underlying rate has continued to fall in response to weak consumer demand and smaller rises in food prices. But retail price inflation excluding mortgage interest payments remains at around 5½ per cent, somewhat above producer price inflation. This partly reflects the stubbornness of inflation in some services prices.

Pay settlements have fallen in response to falling inflation, weak labour market conditions and pressure on companies to maintain competitiveness. Provisional CBI data show settlements in manufacturing in the last quarter of 1991 averaging 4 per cent compared with 9 per cent a year earlier. Whole economy underlying earnings growth stood at 7¼ per cent in December, compared with a peak of 10¼ per cent in July 1990. This is the first time since 1967 that underlying earnings growth has been below 7½ per cent.

Prospects

Earnings growth should continue to fall over the coming year as lower settlements feed through, although there may be some pick-up in wage drift as activity increases. A cyclical recovery in productivity should also help to restrain manufacturers' unit labour costs, which are forecast to fall as the recovery gathers pace. This underpins the forecast of further falls in producer price inflation, to 2 per cent in the fourth quarter of 1992 and 1½ per cent by the middle of 1993. There should still be scope for companies to rebuild profit margins as demand rises.

Underlying retail price inflation is also expected to fall through 1992 as producer price inflation continues to fall, and services prices increasingly respond to disinflationary pressures. Headline inflation may pick up in the coming months as the effects of last year's mortgage rate cuts and the 1991 Budget switch from the community charge to VAT drop out of the calculation. But RPI inflation is forecast to be down to 3¾ per cent by the fourth quarter of 1992 and 3¼ per cent by the second quarter of 1993.

Table 5 Retail and producer output price inflation

	Weights in 1992 ¹	Percentage changes on a year earlier

Other	67½	8	3½	2¾
Total RPI	100	4¼	3¾	3¼
Producer output prices²		3¼	2	1½

¹ Provisional.

² Excluding food, drink and tobacco.

The expected progress on underlying inflation is also reflected in the forecast for the GDP deflator, which measures the price of domestic value added (principally unit labour costs and profits per unit of output). The GDP deflator is expected to rise by 7 per cent in 1991-92, of which the 1991 Budget VAT increase contributes about 1 per cent, but by only 4½ per cent in 1992-93.

Exchange rates and interest rates

Since the UK joined the ERM, the gap between UK interest rates and those in the low inflation ERM countries has narrowed sharply as UK base rates have been cut to 10½ per cent from 15 per cent. The gap between base rates and official interest rates in Europe fell further in mid-December last year when all other ERM countries increased their official interest rates, and UK rates were unchanged.

Following the December rise in other European interest rates, sterling fell, reaching its lowest value against the Deutschmark since ERM entry. But the Government's firm public commitment to the existing ERM parities and the growing awareness in the foreign exchange markets of the improved prospects for UK inflation helped to ensure that the pressure was short-lived.

Long term interest rates over the last year have been on a downward trend, consistent with market expectations of falling short term rates and inflation. The yield on 20-year gilts has fallen from 10¼ per cent at the beginning of last year to little over 9 per cent on average in recent weeks.

Money and credit

The annual growth rate of M0 has remained comfortably within its 0-4 per cent target range for the first ten months of 1991-92. In the first half of the financial year M0 growth was a little below the mid-point of the range; in the second half it has been a little above the mid-point. M0 velocity growth has been consistent with its long term trend.

The annual growth rate of M4 has continued the fall which started in early 1990. Then it was about 18 per cent; in January this year it was about 6 per cent. Banking and building society lending growth peaked at around 25 per cent at the end of 1988; since then it too has fallen to about 6 per cent. Recent figures suggest that the sharp declines in the growth rates of M4 and bank and building society lending may have come to an end. M4 velocity, which has been on a steep downward trend since the early 1980s, appears to have fallen only marginally over the last year.

Lower borrowing for house purchase has played a significant part in the slowdown of lending growth. But persons' other borrowing has remained subdued. The personal sector debt-income ratio, which rose steeply in the 1980s, partly reflecting financial liberalisation, seems now to have stabilised and may even be falling back a little.

Firms have also been cutting back on bank borrowing. Market conditions in 1991 have led them to prefer capital issues as a source of finance. Although M4 and M4 lending growth rates are at low levels as a result of the slowdown in activity, there is little evidence that the economic recovery in prospect will be inhibited by a shortage of bank or building society credit.

Forecast and outturn

Table 6 compares the main elements of the forecast published in the 1991 FSBR with the outturns for 1991 or the latest estimates for 1991-92.

Inflation in 1991 was much as forecast. Errors on the forecasts of demand, activity and the current account were within the average errors from past forecasts. GDP in 1991 fell by a little more than forecast. Partly as a result the current account deficit was smaller than forecast. And the public sector borrowing requirement is likely to be well above last year's Budget forecast, though the error was no larger than the past average.

Table 6 Forecast and outturn

Risks and uncertainties

All forecasts are subject to risks and uncertainties. The forecasts published at the time of the last Budget and Autumn Statement both emphasised that these are most acute when the economy is at a turning point. This remains true on this occasion. The forecasts presented here are central forecasts, a balance of upside and downside risks. Average errors from previous forecasts are given in Table 7.

CHANGES IN THE STRUCTURE OF MANUFACTURING INDUSTRY 1973-1989 AS MEASURED BY THE ANNUAL CENSUS OF PRODUCTION.

DEREK BASKERVILLE, Statistician, Central Statistical Office

BACKGROUND.

The collection of industrial statistics in the United Kingdom began in the Industrial Revolution and developed throughout the 19th century, but the first census of production was not carried out until 1907. Apart from the two world wars, censuses were held at roughly five year intervals right up to 1968.

The industrial scope of the census changed little over the years covering mining and quarrying, manufacturing, construction, gas, electricity and water. Census forms were sent mainly to units with 25 or more employees, although for some industries where small firms predominated, the cut off was lowered to 11.

Because the censuses were large and because they were conducted at five-yearly intervals the results took a long time to produce, sometimes as much as 4 years. This attracted much criticism in the 1960s and as a result of the recommendations of a government committee, a new system of industrial statistics was proposed.

This was introduced in 1970 and the Business Statistics Office (BSO) of the then Board of Trade was set up to implement it. There were four basic components - monthly inquiries to support the index of production, quarterly sales inquiries, five yearly purchases inquiries and the annual census of production. This article presents statistics produced from the annual census of production.

The censuses for 1970 to 1973 were addressed to all census units in scope of the inquiries with an employment of 25 or more, with all smaller units exempted. When the UK joined the European Economic Community in 1973, it became necessary to conform to the statutory requirements for statistical information in force in the Community. Because of this, from the 1973 census, the employment cut-off was lowered from 25 to 20 and the range of questions asked was extended to cover expenditure on non-industrial services which had not been covered previously. The number of forms despatched for the 1973 census was around 33,000.

In the late 1970s concerns about the form filling burden on the business community and about public expenditure resulted in a reduction in the numbers of census forms despatched. As a result around one in four of businesses with an employment of between 20 and 49 now receive a census form each year, together with around half of those with an employment of between 50 and 99 and all larger businesses.

The number of businesses engaged in manufacturing industry has changed over the years and are now estimated at almost 150,000, but the numbers sampled in the census are much smaller, at around 17,000. However, the majority of businesses are very small and the

although only some 10 per cent of businesses are required to complete forms, those from which completed census returns are received, account for some 80 per cent of total manufacturing employment. Estimates of census data are made for those businesses not making returns to the census but these only account for some 20 per cent or so of the total.

In any analysis of a time series of census data, account should be taken of any significant discontinuities. The most important of these in recent years has resulted from a change to the register of businesses, which forms the basis for the compilation of the results of the census. Before 1984 there was no single reliable source of information for updating register data on births or deaths of businesses. The Register could not therefore be relied upon to be up to date.

In 1984 a Register of businesses based on VAT registrations was adopted by the BSO. This enabled both births and deaths to be identified relatively quickly. Businesses not registered for VAT could not be identified, but these are relatively unimportant in relation to their economic activity and it was unlikely that businesses of this size would have been picked up by the earlier Register. The net impact of the change to the new VAT based Register was a large increase in the number of businesses classified to manufacturing industry and the total number of businesses rose from 102 thousand in 1983 to 136 thousand in 1984, although the numbers employed by these businesses increased the estimate of manufacturing employment by only 1.3 per cent. However, the effect on individual industries was often larger and in particular the effect on Class 49 of the 1980 Standard Industrial Classification (Miscellaneous Manufacturing Industries) was to increase the estimate of total employment by 67 per cent.

Another change to the Register of businesses resulted from the introduction of company based reporting. Up until 1986 the reporting unit to the census was called the establishment. In most cases this represented a single company but in others it represented part of a company engaged in a single manufacturing activity or located at different sites. This reflected the desire in the census to collect figures from the smallest possible unit that could provide the full range of required statistics.

In 1987 there was a move to collect statistics from the companies themselves rather than the individual establishments and this led to an aggregation of many of the former reporting units. This was expected to result in a better coverage of production industry since it could not always be assumed that the collective returns for individual establishments would represent the activity of the company as a whole. For a variety of reasons, some reporting units were allowed to remain as establishments. Some were manufacturing units of companies which were not classified to manufacturing or represented parts of companies with significant activities in the different countries of the UK. Others represented parts of companies with a very large involvement in a number of different industries and for which separate figures were required to meet the needs of other CSO inquiries. The main effect of the move to company based

reporting was not so much an increase in the aggregate data for manufacturing industry, but a change in the industries to which the parts of the new reporting units had been classified. The new mix of companies and establishments is referred to as "businesses".

Another major change to the series of data collected in the census was the introduction, in 1980, of a revised Standard Industrial Classification SIC(80) which replaced the previous version SIC(68). This new classification introduced changes into the definition of manufacturing industry. The largest components of this were the loss of industries concerned with the processing of oil and petroleum products and the gain of the quarrying industries. In order to avoid the loss of continuity, the results of the 1979 census were calculated on the basis of both the old and the new industrial classifications.

DATA COLLECTED

The data collected in the census are normally capable of being provided from information available for the preparation of the businesses accounts. Questions are asked on the period covered by the return, which may be for an accounting year rather than a calendar year and details of the numbers employed broken down by working proprietors, administrative staff and other employees. Details of wages and salaries and related employment costs are also requested.

The next four questions relate to income subdivided into sales of own production, merchanted goods, industrial and non-industrial services provided. For expenditure there are three questions relating to the purchases of industrial goods and services and for larger businesses only, (those with an employment of 100 or more) there are questions on the cost of non-industrial services. For those questions which are asked only of the larger businesses, estimates are made for the smaller businesses.

Detailed questions are also asked on stocks and capital expenditure, and for only those industries where it is appropriate, information on excise duties, levies and subsidies.

Although the data collected in the census provide figures collected on a consistent basis, they are not necessarily consistent with data collected elsewhere. For example, employment data from the annual census collected from a legal unit, with all its data classified to a single industry, will not necessarily be consistent with data collected by the Department of Employment where data is collected from parts of legal units, each of which may be classified differently. This and the separate register sources used for each inquiry make it difficult to relate these two sets of data. However, there are plans for an interdepartmental business register which, when implemented, should enable data from the two sources to be reconcilable.

SUMMARY DATA

Table A provides a summary of census data on employment, income and costs from 1973 to 1989 expressed in prices current at the time. The break at 1979 and the two sets of figures provided for that year are due to the introduction of the new industrial classification mentioned above. This break represents a shift in the definition of manufacturing industry which must be taken into account when interpreting the figures in this and in other tables. Ideally the data in the table should also be expressed in constant prices and an attempt to do this for sales only is shown in Table C. As with all other tables, this table includes estimates for businesses not completing census forms.

In the table, the large change in 1984 in the numbers of businesses reflects the move to a VAT based register discussed at paragraph 9. The fall in manufacturing employment reflects a well known trend, although employment generated by this activity may not have fallen to the same extent.

TABLE A

1989	151,584	4,953	12,884	306,080	29,706	10,231	26,916

Table B, shows the percentage of total sales accounted for by the sales of goods which are not the products of business making the census return (merchanted goods). This shows a steady increase from 6.9 per cent of total sales in 1973 to 9.7 per cent in 1989. This change is thought to have resulted from the need to offer customers a range of products related to a businesses own production. The employment generated by this activity is not strictly manufacturing employment. Taking 1973 as a base for comparison and removing the employment generated by the additional merchenting activity then the decline in manufacturing employment is perhaps larger than the basic figures suggest.

On the other hand expenditure on both industrial and non-industrial services compared with the income from sales has increased significantly. Expenditure on industrial services generally covers work bought from other manufacturing businesses but that on non-industrial services does not since such work is normally purchased from outside manufacturing industry.

The value of expenditure on non-industrial services has risen from just 4.6 per cent in 1973 to 8.8 per cent in 1989. A half a percentage point resulted from the change in the industrial classification and this can be discounted. The reasons for the rest of the change are mixed. There are services such as computing which are bought now but for which there may not have been a need twenty years ago. There are also services which might now be bought in larger measure such as advertising, but possibly the largest share of the increase comes from services which were formally carried out in-house such as transport, catering and accounting services. These generated manufacturing employment in 1973 but where they have been contracted out they now generate employment in the distribution or services sector. The same activity may be taking place, but the employment is being recorded differently.

TABLE B
Values of selected variables as a percentage
of total sales.

Year	Sales of merchanted goods	Cost of Industrial services	Cost of Non-industrial services
SIC(68)			
1973	6.9	2.7	4.6
1974	7.0	2.8	4.6
1975	6.8	2.7	5.0
1976	7.5	2.6	5.1
1977	7.9	2.7	5.3
1978	8.4	2.9	5.8
1979	8.6	2.9	6.1
SIC(80)			
1979	8.8	3.0	6.6
1980	8.6	2.8	7.0
1981	8.8	2.8	7.7
1982	8.9	2.9	8.0
1983	9.3	2.8	8.0
1984	9.1	2.9	8.1
1985	9.0	3.0	7.9
1986	8.7	3.2	8.3
1987	8.7	3.2	8.5
1988	9.3	3.2	8.5
1989	9.7	3.3	8.8

If the sales of merchanted goods in 1989 as a percentage of total sales were still at their 1973 level (adjusted for the change in the Standard Industrial Classification) then they would be some £8.6bn less. The employment generated by this activity would be substantially smaller than that generated by a similar value of manufacturing activity but can be estimated, using sales per head ratios, at around 25,000. This implies that manufacturing employment is higher than would have been the case had 1973 conditions still applied.

The effect of the increased expenditure on non-industrial services between 1973 and 1989 operates in the opposite direction. A similar calculation can be made to determine how this change can be converted into employment. If it is assumed that the price of these services has increased at a rate similar to that for the value of sales and that by using employment costs per head (making some allowance for business overheads) the additional cost of non-industrial services can be converted into employment, then the total employment in 1989 can be estimated at up to ¾ million higher than the figure actually recorded. Overall quite a substantial part of the recorded fall of 2½ million from 1973.

CONSTANT PRICE DATA

While figures to enable all the data in Table A to be deflated to constant prices are not readily available, it is relatively simple to provide some idea of the trends in the value of total sales and work done by deflating the current price figures using producer price indices. Although fairly arbitrary, this calculation does at least enable a time series of census data to be interpreted more easily. Comparisons with other series, especially the index of production for manufacturing industries, are inappropriate due to differences such

as the inclusion in the latter of changes in stocks. Table C shows total sales and work done at constant 1979 prices and also shows the same figures expressed as an index. In addition it provides figures showing the trend in sales per head which is also of interest. Comparisons over time must take account of the break in the series in 1979 resulting from the change in the industrial classification. The indices, by setting 1979 as 100 effectively bridge this gap. For example, at constant prices, the 1988 sales at 105.2 are in excess of the 1974 figures of 103.0.

TABLE C

Year	Total Sales and Work Done at constant 1979 prices.			
SIC(68)	Total Sales and Work Done £m	Index 1979=100	Total Sales and Work Done per head £	Per head index 1979=100
1973	160,166	99.7	21,173	96.0
1974	168,245	103.0	21,486	94.5
1975	156,938	96.5	20,770	92.1
1976	162,007	99.8	22,102	96.9
1977	158,514	98.6	21,896	98.5
1978	157,904	97.9	22,278	99.6
1979	161,709	100.0	23,348	100.0
SIC(80)				
1979	152,073	100.0	22,008	100.0
1980	142,365	93.2	21,812	96.1
1981	131,191	87.9	23,123	99.5
1982	130,217	87.3	24,764	106.1
1983	132,117	89.0	26,643	115.0
1984	138,289	93.3	28,040	121.3
1985	142,536	96.0	29,348	125.2
1986	140,608	95.0	29,611	129.3
1987	147,962	99.5	31,044	137.4
1988	157,155	105.2	32,437	144.9
1989	162,814	108.7	33,361	150.2

These figures show much more clearly the trend in total sales than can figures in current prices and they demonstrate that the output levels of the early 1970s have only comparatively recently been bettered. The trend in sales per head provides a much rosier picture showing a steady increase, particularly marked in recent years. However, given that employment figures might have been higher if the suggested transfer from manufacturing to other sectors had not taken place then perhaps the real increase in sales per head, although significant, would not be quite as great as the above figures would suggest.

REGIONAL DATA

In addition to the census records created on the computer to hold data for each business, records are created for each of the addresses covered by businesses which operate at more than one location. Detailed information is not sought in respect of each of the individual addresses but businesses are asked to provide figures for the employment and capital expenditure at each address. It is then possible to estimate the values at each address for variables such as Gross Value Added, by apportioning the data for the whole return according to the employment at each address.

TABLE D1

Manufacturing employment by region.

Table D1 shows employment by region and also the employment expressed as a percentage of the UK total. Despite the many structural changes in industry over the past fifteen years the percentages show a remarkable consistency.

This consistency is not shown in Table D2. This table expresses the capital expenditure per head in each region as an index, with the UK average equal to 100. Here it can be seen that the North and Wales have had a consistently higher share of capital expenditure per head than the UK as a whole, although the extent of this for the North has reduced in recent years. This may be accounted for by a predominance of industries in the North and Wales with a high capital expenditure per head, for example, metal manufacturing.

TABLE D2
Manufacturing capital expenditure per head, by region, expressed as an index. UK average = 100

REGION	SIC(68)			SIC(80)		
	1973	1976	1979	1982	1985	1988
North	140	244	166	106	133	114

United Kingdom	100	100	100	100	100	100

Table D3 is similar to Table D2, but shows Gross Value Added per head. It begins with 1976 because no figures were published for this variable before that year. A high figure for value added per head may provide some indication of profitability, but again a more in depth analysis of the data is necessary before any firm conclusions can be drawn. As with capital expenditure, much may depend on the mix of industries. A region with a relatively large activity in an industry where there is a high value added per head, can appear to be performing better merely because of this. A high value added might also represent a predominance of capital, rather than labour, intensive industries. Metal manufacturing provides an example again.

TABLE D3
Manufacturing Gross Value Added per head, by region, expressed as an index. UK average = 100

REGION	SIC(68)		SIC(80)		
	1976	1979	1982	1985	1988

North West	102	103	102	102	104
England	100	100	100	100	100
Wales	109	111	98	100	110
Scotland	102	98	107	106	102
N Ireland	89	79	81	80	77
United Kingdom	100	100	100	100	100

There is an additional difficulty in interpreting the data in this table because of the way in which figures for businesses which straddle regions are apportioned. However, to put this into perspective it may be noted that single site businesses which are by definition located in a single region, account for over half of total employment and of the remainder the bulk of the employment of most businesses is located in a single region.

FOREIGN OWNERSHIP

The ownership of manufacturing industry in the UK is an area of much interest. In the census of production each business can be linked with others under common ownership or control. Collectively these are referred to as the "enterprise group". If the enterprise group is controlled or owned by companies incorporated overseas the businesses in the group are considered to be foreign owned.

TABLE E1

Analysis by Foreign ownership. Private sector manufacturing industry only.

a Total private sector				b Foreign owned			c % Foreign owned					

From table E1 it can be seen that the proportion of employment in foreign owned businesses increased between 1973 and 1977 but since then has remained fairly constant. Much the same can be said of Gross Output, Gross Value Added and capital expenditure although it will not go unnoticed from table E2 that the per head values of foreign based businesses greatly exceed those of UK based businesses. As with regional analyses, before inferring that foreign owned businesses invest more or are more productive, it is important to examine the mix of industries in which they are involved.

INDUSTRIAL CONCENTRATION

There are many ways of measuring industrial concentration. For example in individual manufacturing industries the share of industry accounted for by the largest contributing enterprise groups is often used. In the annual census of production figures are usually published for the largest five, although the contribution of other numbers of enterprises can often be seen from the size-banded tables. Table F provides information for manufacturing industry as a whole restricted to the 100 largest enterprise groups.

TABLE E2

Year	Gross Output Per Head			Gross Value Added Per Head			Net Capital Expenditure Per Head		
	£			£			£

a Total private sector				b Foreign owned					

Despite constant activity in take-overs and mergers, the concentration in manufacturing appears to have decreased slightly in recent years. It must, however, not be forgotten that Register changes in 1984 resulted in an apparent increase in total manufacturing employment of 1.3 per cent, all in small businesses, and that this should be taken into account in drawing any conclusions from the data in the table. Total sales, Gross Value Added and capital expenditure all show the 100 largest businesses to have a higher share of the total than does employment, but it would take a further analysis of the data to show whether this was due to bigger being better or due to a mix of industries in which higher sales per head etc are the norm.

TABLE F

100 largest enterprise groups

Year	Percentage share of total			
	Employment	Sales	Gross Value Added	Capital Expenditure

1989	30	37	36	34

OPERATING RATIOS

Operating ratios are measures which are compiled from census data for each industry in order to allow businesses to compare their performance with those of similar businesses. Table G shows a selection of these ratios for manufacturing as a whole.

One of the most important trends is that shown by the value of stocks as a percentage of total sales. The reduction has been progressive since 1981 and must represent a significant increase in efficiency. Many reasons have been suggested for falls in the stock/output ratio, but the most important is probably improved stock control methods and the desire to reduce the overheads which accompany high stocking levels. It has also been suggested that, in manufacturing, sectors with high stock/output ratios have declined relative to other sectors, but this does not appear to be borne out by an examination of the figures for individual industries. Stock/output ratios are also compiled from the quarterly inquiries into stockbuilding and are published in CSO Bulletins.

Gross Value Added represents the income generated by businesses out of which they have to pay wages and salaries, the cost of capital

investment and financial charges before arriving at a figure for profit. The cost of wages and salaries and of capital expenditure are often related in that a high capital expenditure often leads to a reduction in the level of employment needed to produce the same or better output. Table G shows a steady reduction in wages and salaries as a percentage of GVA while capital expenditure shows a steady increase, retreating occasionally with the state of the economy.

TABLE G

Year	Stocks as % Total Sales	Wages & Salaries	Capital Expenditure	Ratio of Operatives to Administrative & Technical staff
SIC(68)		(as % Gross Value Added)		
1973	21.5	54.2	9.6	2.8
1974	23.3	53.2	10.5	2.8
1975	22.0	58.4	10.9	2.7
1976	22.9	55.3	10.0	2.6
1977	22.3	54.0	10.9	2.6
1978	22.5	54.7	12.0	2.5
1979	22.8	53.7	12.3	2.5
SIC(80)				
1979	23.0	55.8	12.5	2.5
1980	22.5	59.8	11.4	2.3
1981	22.9	60.0	9.5	2.2
1982	21.4	57.6	9.1	2.2
1983	20.9	54.8	9.2	2.1
1984	20.3	54.2	10.7	2.2
1985	19.2	53.9	11.4	2.1
1986	18.6	53.6	10.8	2.2
1987	17.7	51.7	10.9	2.1
1988	17.2	50.7	12.2	2.1
1989	16.8	51.2	13.4	2.1

The last column in the table shows the ratio between the number of administrative, technical and clerical employees (ATCs) and other workers (Operatives). The main feature is a steady decline to 1983 but little change since. Many businesses now find it difficult to differentiate between the two groups of employees in the past often divided into wage and salary earners.

IN CONCLUSION

The above tables show only a small fraction of the data available from the annual census of production and does not attempt to show the full range of special analyses that can be carried out using the available data. Many organisations make use of this data by asking the CSO to carry out analyses to their specifications. The CSO charges for these analyses but this charge does not include any amount which might represent an attempt to recover any of the costs of collecting the data.

The annual census of production is likely to go through a period of change over the next decade with the introduction of a new Standard Industrial Classification SIC(92) and plans by the EC to revise the Directives under which census data are provided. Some data items, perhaps the split between the above categories may be dropped and new and more relevant data added to replace them. These will give rise to a whole new range of statistics from which we can evaluate changes and progress in manufacturing industry.

THE INTER-DEPARTMENTAL BUSINESS REGISTER

Introduction

The Central Statistical Office (CSO) and Employment Department (ED) have recently agreed to create a new register of businesses for their statistical inquiries. This Inter-Departmental Business Register (IDBR) will make a major contribution to the drive for better economic statistics. Although primarily for the statistical work of the two departments, it will be used more widely. In particular, it will form the basis of statistical inquiries within the Northern Ireland Department of Economic Development and of construction inquiries within the Department of the Environment (DOE).

Both the CSO and the ED collect key economic data from businesses. The CSO conducts a wide range of statistical inquiries. The results are used, along with information from other sources, in the compilation of the national accounts. The ED collects labour market information from businesses, which is also used in the national accounts.

The use of different registers results in inconsistencies in output measures and inefficiencies in maintenance. The registers generate significantly different estimates of employment due to differences in classification and coverage. The advantages of a central register of businesses, which would be available for use by all government bodies in conducting statistical inquiries, have been acknowledged for many years. In 1968, Jack Stafford, the Director of Statistics at the Board of Trade, wrote:

"In the statistical service we believe that the first essential step to the better system which is planned is the creation of a common register of business establishments, and other reporting and accounting units such as companies, businesses units and enterprises, which can be used for all industrial statistics and which, when established, will enable the results of different inquiries to be related and to form an integrated system of information. The Estimates Committee expressed great interest in the compilation and use of a register of this kind." (1)

The first steps towards a central register were taken during the 1970s and 1980s when the Business Statistics Office (BSO) created a register of businesses for its own inquiries. In 1987 a joint BSO and Department of Employment study was initiated to consider the practical problems of either integrating their business registers or linking them together and of keeping the register or registers up to date. The main impetus for the study had been a review of statistics within the ED. Several departments had expressed concern about inconsistencies between the output estimates (based on BSO inquiries) and the employment estimates (produced by the ED) which were being used together in calculating output per head. The study reported in 1989 that a combined register was feasible and during the following year the practical issues of integration were investigated.

The Pickford review of government economic statistics (2) resulted in the CSO widening its role in collecting data. In particular, the BSO moved from the Department of Trade and Industry. The review also provided support for the IDBR.

Existing system - CSO

The CSO maintains a single register for its major business inquiries. This register is based on traders registered for VAT with HM Customs and Excise (C&E). VAT covers around 1.8 million businesses in the UK.

The transfer to the CSO of data on individual VAT traders is permitted under Section 44 of the VAT Act 1983. The limited range of data items transferred include the name and address of the business, its industrial classification and turnover, and its date of registration and (where appropriate) deregistration. Coverage is generally good with exemption from liability for VAT affecting only a few traders (notably parts of health and education). The smallest traders (currently those with turnover below £36,600), however, register only voluntarily. Quality is generally high, although the type of activity is self-coded and still based on the 1968 revision to the Standard Industrial Classification [SIC (Revised 1968)]. C&E are considering introducing a new classification based on the SIC (Revised 1992). Information is received promptly from C&E on a weekly basis.

The CSO business register is updated dynamically, that is it reflects the latest known information about the structure of businesses in the UK. It is possible to produce cross-sectional analyses of business activity at any time (3) and to produce limited analyses of births and deaths of businesses (4). Size and classification, however, are updated only once a year to satisfy the needs of CSO inquiries. When selections are made for a statistical inquiry, the necessary information is extracted from the register into a "frozen" inquiry processing file. The register is then used for mailing inquiry forms, including reminder action. The register system is not used to analyse the completed survey forms.

Existing System - Employment Department

The ED maintains an Employment Statistics System (ESS) which supports the selection and processing of the Census of Employment and other statistical inquiries. The major task for the ESS is the processing of the Census of Employment, currently every two years. Although it is also used for other regular and ad hoc inquiries, the information that it contains is related largely to the Census dates. The ESS stores responses from inquiries as well as the basic register information.

The ESS is based on employers registered with the Inland Revenue Department for "Pay As You Earn" (PAYE) tax purposes and covers around 1.2 million employers in the UK. The transfer of data on individual PAYE collection points to the ED is permitted under the Finance Act 1969. Data items covered include name and business address, scheme type (to identify PAYE schemes with employees), numbers covered by the PAYE scheme, two digit classification code, scheme commencement and cessation date, and previous reference where a scheme has changed. Coverage of employers with employees is good except where all employees earn less than the income tax threshold and thus do not need to be registered in the PAYE scheme. In addition, those businesses that

operate without employees are generally excluded from the register. Information is received quarterly from the Inland Revenue Department.

Industry classification within the ED register is of mixed quality. Those units surveyed by ED are split into separate sites where relevant and each is classified to the 4-digit level of the SIC Revised 1980; these classifications are based on business descriptions provided by the employer and are generally reliable. In Great Britain, smaller PAYE units are surveyed on a sample basis; the majority are not surveyed and their classification is not reliable. This is not so in Northern Ireland, where the Census of Employment covers all employers.

The Inter-Departmental Business Register (IDBR)

Both existing registers are based predominantly on administrative data and there are no other administrative sources that are as comprehensive as the VAT and PAYE data. The possibility of using Schedule D (self-employed) data to supplement PAYE as the basis of a register with effectively complete coverage of the whole economy was examined but rejected because of technical, legal and quality issues.

Companies House registers all incorporated businesses but does not keep records of other businesses, mainly the sole proprietors and the partnerships. The option of maintaining a register without administrative inputs would be excessively costly and was also rejected.

The options left were to base the register on either VAT or PAYE (single-sourcing) or on both VAT and PAYE (dual-sourcing). Dual-sourcing is more costly because of the need to match sources and the need to eliminate duplication. It is, however, affected less by changes in administrative systems (for example increases in the VAT threshold) and more comprehensive.

The major problem in creating a register based on two sources, is the need to ensure that information is not duplicated. There is no standard referencing system to identify businesses within the UK. The VAT trader reference does not appear on the PAYE system and the PAYE collection number is internal to that system.

Initial matching will be on the basis of names and addresses but where a match cannot be confirmed it will be necessary to contact the business to check the information. The procedure will be to collect VAT numbers through the Census of Employment and to conduct register proving mailings for new PAYE registrations to obtain their VAT numbers (this is already done on a sample basis to maintain a representative quarterly sample). With a link established between the two administrative inputs a high quality register is then feasible.

The register will be used for both national accounts and labour market statistics as well as providing basic information on the structure of the economy (for example, on births and deaths of businesses). It offers the potential to share information between departments and hence to reduce the number and scale of statistical inquiries to businesses. It will lead to a single and more reliable set of employment estimates, improving the consistency of the national accounts and the quality of the productivity and unit wage cost estimates. It will contribute to ED measures to reduce the need for large revisions to its employment estimates in all sectors of the economy and permit improved analyses of trends in the small firms sector. An IDBR for the UK is also seen as essential in improving statistics for Northern Ireland. (5)

To provide the best possible sampling frame for all inquiries and for survey and analytical purposes, the IDBR will be updated each time

new information becomes available. All inquiry processing will be "off the register", that is files will be extracted to form the basis of inquiry processing systems. This method provides flexibility for the increasing number of users in both CSO and ED.

Statistical units

Business structures are complex and are based on administrative procedures that are often not suitable for statistical inquiries. The VAT unit is there simply to facilitate the collection of VAT and may not be able to provide information of the type required within, for example, the Annual Census of Production. Also some employers maintain separate PAYE schemes for salaried and non-salaried workers, giving two administrative units for the same work-place. For these reasons the administrative data will be mapped onto statistical units for the purpose of statistical inquiries.

There will be two types of business unit: the administrative unit and the statistical unit. In the IDBR the administrative units will be:

VAT traders - usually individual legal units (companies, sole proprietors etc) but occasionally operating divisions of companies;

PAYE scheme units - often legal units but in many instances parts of groups of legal units through which employees are paid.

From these the statistical units (enterprise group, enterprise and local unit) will be generated.

The enterprise group is the group of legal units under common control. The enterprise is the smallest group of legal units within an enterprise group with autonomy. The local unit is the individual site (factory, shop etc) at which activity takes place; it usually has one major activity. Reporting units based on the enterprise and the local unit will be set up to obtain responses to inquiries. A simplified view of the logical structure of the register is shown in figure 1. It is essential that these units are maintained so that data from many sources can be merged in a consistent fashion.

Computer systems

The CSO operates its statistical inquiries predominantly from its offices in Newport but it also has two offices in London. The ED operates from central London, Watford and Runcorn. The existing register computer systems are located in Newport (CSO) and Runcorn (ED) with limited communications links between the two. Most transfers of data are by magnetic tape.

The computer to be used is the subject of tender arrangements but is likely to be a UNIX machine with a relational database management system (RDBMS). This is quite different from the existing systems based on ICL 39 series computers under VME but ties in with the IT strategies of the two departments. The location of the computer will depend on the outcome of the tender process but access will be provided at Newport, Runcorn and other sites.

Concern about the ability of relational database management systems to deal with the task have resulted in large-scale prototypes being set-up. To date there have been two prototypes: one covering production and retail trades; and one for Northern Ireland. The latter prototype is being developed using INGRES on a SEQUENT computer and will be used for inquiry selections in 1992. Prototyping has helped in testing the capabilities of INGRES and in developing the user requirement. The prototypes have shown that the objectives can be achieved.

Timetable and costs

Creation of the inter-departmental register is a lengthy process. Work has started already on a system covering activity in Northern Ireland (about 2% of the eventual register). The register will be available for its first Northern Ireland inquiry selections in 1992 and for other selections from 1993. The Census of Employment in September 1993 will be a full Census for all of the UK, that is it will involve contact with all employers. Although the register will not be ready for the Census mail-out, it will take information from it using VAT numbers collected on the Census forms. Once the Census data have been taken on, the IDBR creation will be complete.

The project will involve extensive computer and clerical inputs from both the CSO and ED. The total cost over the three years of the development is put at £4.3 million. One-third of this figure covers the purchase of the computer, one-sixth the programming staff and the remaining half the clerical staff. The large clerical input, which amounts to 50 staff, will be required for the extensive matching and quality checking work. These costs exclude those of the Census of Employment.

Legal issues

The transfer of administrative data that form the main input to the IDBR is governed by the VAT Act 1983 and the Finance Act 1969. They limit the use of data to government and to a small number of other specified purposes. The inquiries conducted by the CSO and the ED are generally statutory under the Statistics of Trade Act 1947 (with separate legislation for Northern Ireland). This allows for some administrative use of register data within central government, where the Minister approves, for example for the administration of regional development. Lists of names and addresses of businesses can be published only with the consent of the business itself. Information on some businesses is also covered by a registration under the Data Protection Act.

The European dimension

EUROSTAT (the Statistical Office of the European Communities) is considering a range of measures to harmonize statistics within the

Community. Two of these are Regulations covering the definitions of statistical units and the harmonization of business registers. The IDBR would satisfy the demands of both Regulations.

Other business registers

The project covers only the main CSO and ED business registers. Other business registers exist within government. The first of these is the separate register of construction businesses maintained by the DOE. The Pickford Review recommended the integration of this register with that held by the CSO. The integration work commenced in July 1991 and is due to be completed in September 1992. The result of this and its subsequent incorporation within the IDBR will be greater consistency in the national accounts between construction and other industries.

Although agriculture forms part of the IDBR, the Ministry of Agriculture, Fisheries and Food (MAFF) maintains a separate register of farm holdings for its Census of Agriculture. There are no plans to integrate this separate register into the IDBR and statistics on agriculture will continue to be collected separately.

The IDBR will not supplant any administrative register. VAT, PAYE and Schedule D tax will continue to be collected through the existing administrative systems, Companies House will continue to control company registrations and the myriad other administrative systems within government will be untouched. What the IDBR will bring is a cohesion to the collection of statistics, ensuring that all businesses are covered and classified consistently by statistics on output, employment, capital expenditure and other important aspects of economic activity.
