### **About the Office for National Statistics**

The Office for National Statistics (ONS) is the government agency responsible for compiling, analysing and disseminating many of the United Kingdom's economic, social and demographic statistics, including the retail prices index, trade figures and labour market data, as well as the periodic census of the population and health statistics. The Director of ONS is also the National Statistician and the Registrar General for England and Wales, and the agency administers the registration of births, marriages and deaths there.

### A National Statistics Publication

National Statistics are produced to high professional standards set out in the National Statistics Code of Practice. They undergo regular quality assurance reviews to ensure that they meet customer needs. They are produced free from any political influence.

# GDP growth

Services rose by 0.9 per cent in the first quarter of this year. Business services and finance continued to grow, by 1.0 per cent in the latest quarter, with the strong growth in computing, banking and real estate services. The distribution, hotels and catering sector rose by 1.7 per cent; growth was strongest in hotels and catering and retailing. The transport and communications sector rose by 0.2 per cent, as a rise of 1.4 per cent in transport and storage was largely offset by a fall of 1.7 per cent in post and telecommunication services. Elsewhere, government and other services rose by 0.4 per cent over the quarter, driven by growth in health services.

Output of the production industries decreased by 0.5 per cent, where manufacturing fell by 0.4 per cent, mining and quarrying fell by 0.8 per cent and energy supply fell by 1.2 per cent. The decline in manufacturing was driven by falls in the output of the chemicals and transport industries.

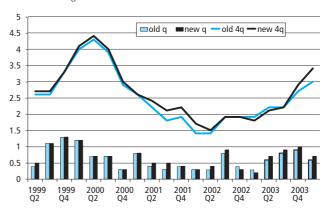

Construction output rose by 0.4 per cent.

Household expenditure rose by 0.6 per cent with continuing growth in expenditure on recreation and culture, food and drink, and clothing and footwear.

Government expenditure rose by 1.2 per cent in the latest quarter. Gross fixed capital formation rose by 1.7 per cent

### **GDP** quarterly growth, percentage CVM

Per cent change

following an increase in investment in plant and machinery and dwellings which offset a fall in transport equipment.

Exports of goods and services fell by 0.9 per cent and imports of goods and services fell by 0.8 per cent.

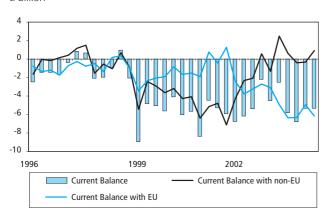

On the income side, compensation of employees in current prices rose by 2.2 per cent, driven by an increase in average earnings, with little change in employment. Corporate incomes fell by 1.6 per cent.

Released: 30 June 2004

# Balance of Payments

# Current account balance with EU and non-EU countries

£ billion

### **Current account**

The current account deficit remained at £5.3 billion (equivalent to 1.9 per cent of GDP) in the first quarter. A rise in the income surplus and fall in the overall trade deficit was offset by a rise in the current transfers' deficit. The current account deficit continues to be funded by foreign investment into UK debt securities.

In 2003 as a whole, the UK had a current account deficit of £22.7 billion with EU countries, primarily due to a trading deficit of £28.8 billion. In contrast, the UK had a surplus of £2.2 billion with non-EU countries, with a surplus on income and trade in services only partly offset by a trade in goods deficit.

### **Revisions**

The current account balance has been revised from the first quarter of 2001. Changes to 2001 and 2002 include final

foreign direct investment inquiry results and changes to trade in services resulting from the annual supply-use balancing exercise. In addition a reassessment of Bank for International Settlements information has led to lower estimates of UK non-banks deposits abroad and interest receipts. Changes to 2003 reflect

the incorporation of later and survey results. These changes reduce the current account deficit by £1.1 billion in 2001, but increase it by £0.4 billion in 2002 and £1.7 billion in 2003.

Released: 30 June 2004

# **Productivity**

In the first quarter of 2004, annual productivity growth for the whole economy was 2.5 per cent, up from growth of 2.1 per cent in the previous quarter. The increase is explained by the acceleration of output on an annual basis, while jobs growth remained unchanged. Annual growth in output was 3.0 per cent, up on growth of 2.5 per cent in the previous quarter.

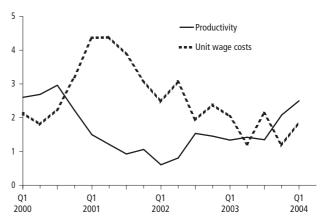

On a quarter on previous quarter basis, productivity growth was 0.4 per cent, down from 0.8 per cent in the previous quarter. This is due to output growth slowing from 1.0 per cent in the fourth quarter to 0.6 per cent in the first quarter.

Annual manufacturing productivity growth was 4.9 per cent, down from 6.0 per cent in the previous quarter. The slowdown in annual productivity growth is a result of a slower rate of manufacturing output growth, combined with a smaller fall in the number of manufacturing jobs than occurred in the previous quarter.

On a quarter on previous quarter basis, manufacturing productivity grew by 0.4 per cent in the first quarter of 2004, down from growth of 1.4 per cent in the previous quarter. This slowdown is also largely explained by the deceleration in manufacturing output, as jobs fell at the same rate as in the previous quarter

Unit wage costs for the whole economy grew by 1.9 per cent in the first quarter of 2004 compared to a year ago, up from

# Whole economy productivity and unit wage costs annual growth

1.2 per cent in the previous quarter. Overall manufacturing unit wage costs showed an annual decline of 1.4 per cent, up from a decline of 2.5 per cent in the previous quarter.

The next Productivity First Release on 30 September will be compiled using a new methodology. Details of this will be published on 21 July.

Released: 1 July 2004

### Inflation rises

CPI inflation – the Government's target measure – rose to 1.5 per cent in May, up from 1.2 per cent in April.

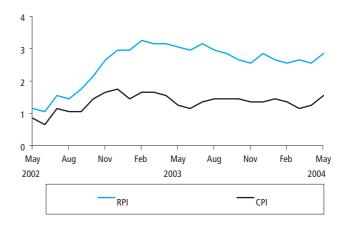

Recent oil market pressures had the largest upward effect on inflation. Average unleaded petrol prices rose to 82 pence per litre in May, from 78 pence per litre in April. Set against significant reductions in prices a year ago, fuel prices added 0.2 percentage points in May to the CPI inflation rate overall.

Inflation in the transport sector was also boosted by seasonal price increases this year particularly for air fares, and also sea fares. By contrast, air fares fell back last year from higher April levels reflecting the later timing of the Easter holidays, and increases in sea fares fed through in April.

Smaller upward effects came from housing-related purchases, especially domestic fuel costs, and also recreation and culture, where price reductions last year for personal computers, CDs, cut flowers and theatre admissions were not repeated this year.

The largest downward effect on CPI inflation came from food

### Annual inflation – 12 month percentage change

where prices overall rose by less than a year ago, helped by reductions this May in the cost of fish, poultry and cakes. Weaker price recoveries and some stronger special offers this year on furniture and furnishings, especially carpets, also had a downward impact.

RPI inflation also increased, to 2.8 per cent in May from 2.5 per cent in April. The all-items rate excluding mortgage interest payments (RPIX) followed suit, rising to 2.3 per cent. Higher petrol prices boosted inflation faced by motorists, although this was partly offset by reductions in car prices and some insurance premiums. Some housing costs that are excluded from the CPI also contributed, in particular with house prices used to calculate depreciation – the amount homeowners need to spend to maintain their property – rising by more than last year.

As an internationally comparable measure of inflation, the CPI shows that the UK inflation rate has been among the lowest in the EU since the start of 2000. The EU 15 average inflation rate for April, the latest available, was 1.8 per cent compared with 1.2 per cent in the UK.

# Economic update July 2004

### **Rhys Herbert**

Office for National Statistics

- First quarter GDP growth was 0.7 per cent, a deceleration from the fourth quarter of last year.
- A strong service sector is leading economic growth and construction output also went up.
- Manufacturing output fell in quarter one but seems to have picked up in April.
- Consumer spending rose by 0.6 per cent in the first quarter and retail sales was buoyant into quarter two.
- Fixed investment rose by 1.5 per cent in the first quarter, a slower rate of growth than at the end of 2003.
- Government spending is currently a positive contributor to economic growth but the public sector finances are falling further into deficit.
- Exports of goods rose again in April for the third month in a row, suggesting that January's big fall was indeed a one-off.
- Labour market aggregates remain largely stable, but average earnings have risen in early 2004.
- Producer price input and output prices went up again in May reflecting the impact of higher oil prices in April.
- The CPI measure of consumer prices is still below target but the inflation rate went up again in May.

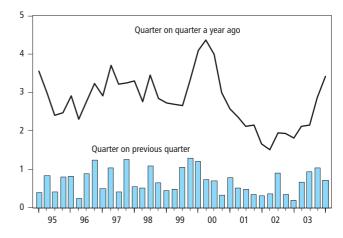

### **GDP** activity – overview

The GDP growth in the first quarter of 2004 is estimated to have grown by 0.7 per cent in the latest set of quarterly National Accounts. This represents a small upward revision of 0.1 per cent when compared with the previously published number. This was lower than the growth rate for the fourth quarter of 2003, of 1.0 per cent. The first quarter annual rate of growth now estimated to be 3.4 per cent is in contrast, stronger than the fourth quarter annual growth rate of 2.9 per cent (Figure 1). As a result of this latest release we now have a much fuller picture of the quarter. The release also contains data revisions for previous years consistent with the annual National Accounts publication, the ONS Blue Book that will be published on 23 July.

First quarter GDP data is now available for most of the major OECD economies and these show that the world economy continued to grow quite strongly in early 2004. First quarter GDP growth in the US at 1.0 per cent was about the same as that for the previous quarter. The growth was led by further strong growth in consumer spending but also reflected buoyancy in most areas of expenditure. Japan had the strongest GDP gains of all the major economies for the second successive quarter, rising by 1.5 per cent. Exports continue to benefit from the impetus given to Asian trade from the rapid growth of China but much of the rise in the first quarter was due to domestic demand. Growth in the

Figure 1 **GDP** 

Growth

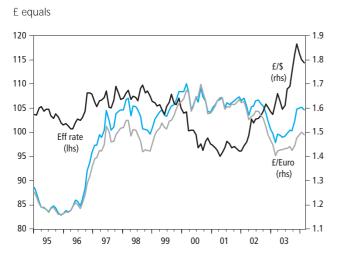

three biggest mainland EU economies, France, Germany and Italy, was rather more sluggish but still quicker than in the fourth quarter. Both Italian GDP and that of Germany rose by 0.4 per cent on the quarter while that of France was somewhat quicker at 0.8 per cent. Unfortunately for the UK, for whom the EU accounts for by far its biggest export market, the rebound particularly for Germany was led by exports, although at least in the case of France domestic demand also picked up.

### **Financial Market activity**

Last year saw some optimism return to the stock market. After three years of declines the FTSE All Share Index ended 2003 up some 16 per cent. However, the recent gains still leave the FTSE All Share down by about 12 per cent compared to its level at the start of 2002. The performance of the stock market so far in 2004 has been a little erratic. It began the first quarter rising quite strongly, but has subsequently been more erratic. The FTSE All Share Index ended the first half of the year up just over 4 per cent when compared with the end of 2003.

The last twelve months or so has seen substantial exchange rate volatility, as sterling has first declined and then rebounded. The early part of last year saw the pound fall against the euro but strengthen against the US dollar, and as a result the effective exchange rate fell by 7.2 per cent between December 2002 and May 2003. From this low the pound's effective rate rose slightly over the rest of the year as sterling continued to be buffeted between a strong euro and a weak dollar. For 2003 as a whole the effective index ended the year down about 5.0 per cent, as a fall of over 8 per cent in the bilateral rate versus the euro was partially offset by a rise of 10 per cent against the dollar (Figure 2). Early 2004 has seen the pound continue to rise, most prominently against the dollar but also recently against the euro as well. At the time of writing the effective exchange rate was above its level at the start of 2003. The rebound may in part be due to the fact that the Bank of England has raised interest rates four times in recent months, by a total of 100 basis points in all, at a time when most other major central banks seem content to keep interest rates stable.

Figure 2 **Exchange rates** 

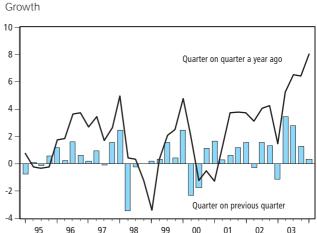

### **Output**

Quarterly GDP growth in the first quarter of 2004 was 0.7 per cent, a slowdown from the fourth quarter of 2003 which saw growth of 0.9 per cent. The annual rate of growth in the first quarter was 3.4 per cent, considerably higher than the fourth quarter annual rate of 2.9 per cent. An alternative measure of economic activity gross value added (GVA) at basic prices (that is, before the impact of taxes and subsidies are taken into account), shows slightly less growth. On this measure growth in the first quarter was 0.6 per cent, compared to a 1.0 per cent rate in the fourth quarter of 2003. Both measures show a similar picture of a slowdown in growth between late last year and early 2004. The various categories of output are initially all calculated at basic prices and their sum is aggregated to produce GVA.

The contribution to growth of the various output categories looks very similar to that of quarter four. However, all sectors grew more slowly in quarter one than at the back end of 2003. The year 2003 was characterised by an accelerating pace of economic growth through the year led by the service sector and to a lesser extent by continued strong construction output growth. Activity in the industrial sector in contrast was more subdued, although manufacturing production seemed to be recovering gradually after a severe downturn. By the fourth quarter, quarterly growth reached 1.0 per cent, the fastest rate for 16 quarters. Quarter 1 of 2004 has seen a slowdown from this very rapid rate but growth remains stronger than in the first half of 2003.

The pace of construction output growth has now been moderating for three quarters in a row following the very rapid rise in activity in quarter two of last year. In early 2004 output seems to have barely risen, only going up by 0.4 per cent on the quarter. The annual rate of growth for the first quarter rose at an impressive pace of 8.1 per cent, however this was primarily a result of the pronounced fall in activity that took place in the first quarter of 2003. External indicators of construction activity such as the CIPS survey suggest that activity slowed down in the first few months of this year but it should be noted that these figures were notably stronger than official statistics at the back end of last year (Figure 3).

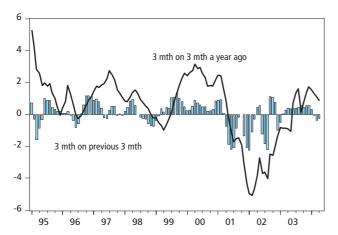

Figure 3 **Construction output** 

Manufacturing output fell by 0.4 per cent in the first quarter of 2004, the first quarterly fall in activity since the back end of 2002 (Figure 4). The decline in output was broadly based but in particular was driven by falls in the sectors paper, printing and publishing and in electrical and optical equipment. Looking at the same quarter a year ago, annual growth in the first quarter was 1.0 per cent a deceleration from the previous quarter's growth rate of 1.7 per cent. The numbers for April in contrast show a rise in activity of around 0.7 per cent although the three month growth rate was still down by 0.2 per cent. External surveys of production have recently in general been stronger than official data.

Figure 4 **Manufacturing output** 

Growth

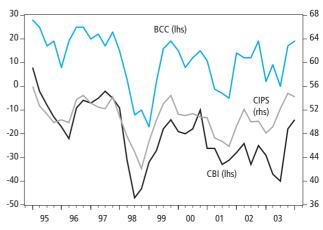

Broadly speaking these surveys recorded rapid rises in activity in the back end of last year and these new higher levels have been maintained into the early months of this year. There has been much comment about the recent lack of correlation between these indicators produced by various business organisations and the official manufacturing output series. It is worth noting that it is by no means unusual for the path of these series to diverge over the short-term although they do tend to move together over the longer term. These differences happen partly because the series are not measuring exactly the same thing. The external surveys measure the direction but not the magnitude of a change in output, as a rising series merely implies that more firms are experiencing a rise in output. Moreover, some of the questions in those surveys measure expectations rather than actual activity, so sometimes the indices may be pushed up or down by changes in expectations. Overall there is no reason to believe that the official data is less reliable than usual. The index is based on an inquiry that is much larger than those of the external surveys and the response rate to the most recent one was no lower than normal. The rise in the official indicator in April has brought the series more into line with each other (Figure 5).

Service growth moderated slightly in quarter one from a particularly rapid rate in quarter four of last year. Quarterly growth was 0.9 per cent in the first quarter of 2004, against 1.2 per cent in the fourth quarter, and 0.9 in the third quarter of last year (Figure 6). Looking at the same quarter a year ago, annual growth in the first quarter was 3.6 per cent, compared with 3.0 per cent in quarter four. The moderation in activity seems to

Figure 5 **External manufacturing** 

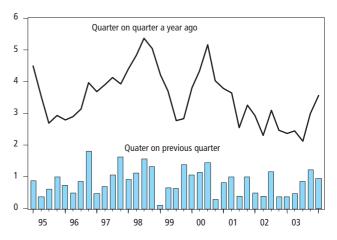

Balances

have centred in particular in business services and finance and in post and telecommunication. Looking at the surveys undertaken by other organisations, the CIPS index of services showed another big rise in both activity and orders in 2004 quarter one and has risen further in the first two months of quarter two. The CBI survey of services also showed strengthening activity in quarter one coupled with an improvement in expectations for the future. Finally, the BCC survey remains very strong confirming the momentum gained in quarter four of last year.

Figure 6 **Services output** 

Growth

### **Household demand**

Quarterly growth in household final consumption was 0.6 per cent in the first quarter of 2004, exactly the same rate as in the fourth quarter of last year and slightly down on the third quarter number of 0.8 per cent. Growth compared with the same quarter a year ago was 3.0 per cent, compared to 2.2 per cent in the previous quarter (Figure 7). Growth for consumption as a whole was significantly weaker than that of retail sales, which rose by 1.9 per cent in quarter and was up 6.4 per cent when compared with the same quarter a year ago. It should though be noted that household consumption accounts for a much wider range of spending than retail sales and that retail sales is still not calculated using chain linking the method now used to produce the GDP numbers.

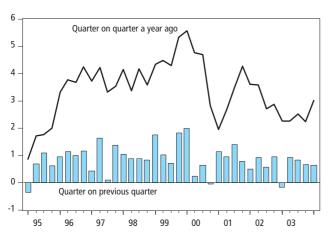

7

The breakdown of consumer spending patterns shows a variable pattern. Spending on goods and particularly on durable goods continues to rise sharply. Spending on durable goods rose by 1.7 per cent in the first quarter compared with 0.5 per cent in quarter four. Spending on semi-durables was also up sharply at 2.7 per cent compared with 3.1 per cent in quarter four. Expenditure on non-durable goods was somewhat weaker at 0.9 per cent the same rate as in the previous quarter. Finally expenditure on services was virtually unchanged for the second successive quarter, implying that spending in this area has now been almost flat for six months.

Figure 7

Household demand

Growth

Most of the fundamentals for consumer spending remain fairly supportive. Real disposable income growth remains consistent with a moderate growth in spending. The labour market is tight and getting tighter and while this does not seem to be having much of an upward effect on wages it should ensure that consumers remain relatively upbeat about their job prospects. Meanwhile consumer confidence is still reasonably high and the continued buoyancy of the housing market and the recovery of the stock market are further positives. There is as yet little hard evidence to suggest that the four base rate hikes since November have had a significant or indeed any impact on consumer behaviour, although some commentary in the media has suggested that the pace of house price rises is now starting to slow.

Initial indications for quarter two is that consumer spending has remained fairly strong. Official retail sales certainly do not provide evidence of a pronounced slowdown. Spending rose by 1.7 per cent in the three months to May and expenditure seems to have gone up particularly sharply in May, rising by 0.8 per cent on the month (Figure 8). External figures provide mixed evidence. Both the BRC and CBI surveys suggested strong growth in quarter 1 and point to a further acceleration in the second quarter (Figure 9).

Figure 8 **Retail sales** 

Growth

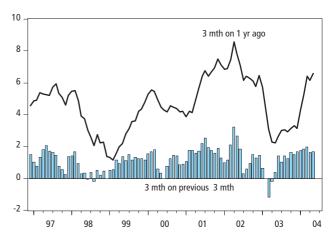

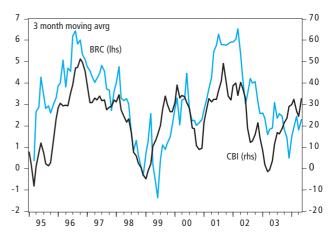

Figure 9 **External retailing** 

Growth

### **Business demand**

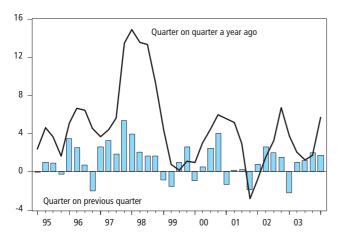

Private Non-Financial Corporation's fixed investment rose by 2.9 per cent in the first quarter and by 13.4 per cent when compared with a year ago, providing some support for the idea that this area of spending is now recovering. Disaggregated investment figures in real terms by asset, are available but only for the economy as a whole and so are not directly comparable. These show that spending on machinery and equipment rose by 3.0 per cent on the quarter, the second consecutive quarter of sizeable gains in this asset. As this has been the area of investment that has been particularly weak in recent years, the improvement is a cause for optimism. Investment in dwellings and in other buildings and equipment were also up but the rise in fixed investment as a whole was held back by a fall in expenditure on transport equipment (Figure 10).

Despite the rise in spending over the last twelve months, the environment still remains a mixed one for investment. An increase in investment depends upon firms finding it both affordable and profitable to invest. The last few quarters has seen an improvement in this to some degree. The first quarter

Figure 10

Fixed Investment

Growth

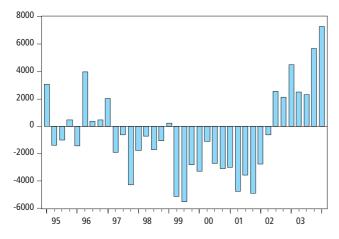

saw the non-financial corporate sector record another big quarterly net lending position due to another rise in the gross operating surplus and a high return on investments (Figure 11). However, because of the high level of borrowing in the late 1990s the corporate sector does still have very high levels of net liabilities. The financial balance sheet shows the sector had net liabilities of £1,327 billion in the first quarter of 2004, another rise when compared with the previous quarter.

Figure 11

Net lending by the Non-financial corporate sector

Balances

It is also unclear whether firms perceive this as a favourable environment in which to boost investment. They generally continue to report a lack of pricing power, and very low capacity utilisation. This combination makes it difficult to see why investment should pick up significantly without a sustained increase in demand, although the most recent surveys of investment intentions have shown an increased willingness to raise spending.

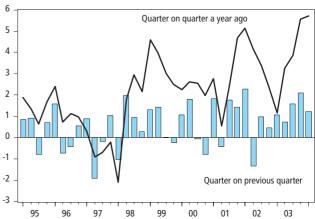

### **Government demand**

Government final consumption expenditure in real terms grew by 1.2 per cent in the first quarter of 2004, a slower pace of growth than in the final quarter of last year when activity rose by 2.1 per cent (Figure 12). Some of the recent strength

reflects higher defence spending, while spending on health is also rising sharply. Growth compared with the same quarter a year ago was up 5.7 per cent, while for 2003 as a whole it had been up 3.5 per cent compared with a 3.8 per cent rate of increase in 2002.

Figure 12 **Government spending** 

Growth

The combination of faster government expenditure growth alongside weaker revenues reflecting the more subdued economic activity has led to deterioration in the public sector's finances. The public sector, a substantial net lender in the years 1998 to 2001 became a net borrower again in 2002. The net borrowing figure for 2002 was £18.2 billion, which compares with a net lending figure of £7.6 billion in the previous year. This deterioration has continued into 2003 and early 2004. Net borrowing in calendar year 2003 was £38.1 billion and the first quarter of 2004 saw a further borrowing of the order of £9.4 billion.

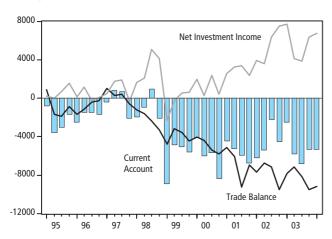

### **Trade and the Balance of Payments**

The UK current account remained in substantial deficit in the first quarter of 2004 at a level almost identical to that of the previous quarter. The first quarter deficit figure was £5.3 billion, the same rate as in the fourth quarter of last year and down on the £6.8 billion deficit of the third quarter. The first quarter figure comprised of a record deficit on trade in goods of £13.9 billion, partially offset both by a rising surplus on trade in services of £4.8 billion and by positive income flows. The fall in the deficit from the third quarter was partly due to a stronger performance on trade in services and partly to more favourable income flows on direct investment activity. The deficit number for last year was revised upward from the earlier estimate due to less favourable figures in trade in goods and investment income (Figure 13).

In volume terms both imports and exports fell in quarter one. The fall in exports, however, was larger and as a result net trade subtracted from GDP growth over the quarter. Exports of goods and services fell by 0.9 per cent over the quarter, compared with a rise of 1.6 per cent in the last quarter of 2003. This fall was solely due to a large decline in exports of goods, as service exports went up (Figure 14). Compared with a year ago exports fell by 1.3 per cent in the first quarter. Year

Figure 13 **Balance of Payments** 

£ million

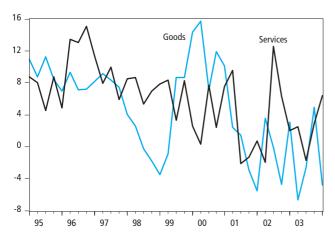

on year growth rates are however, still difficult to interpret because of the distortion due to the impact of MTIC fraud. The discovery of this resulted in the import data for a few years prior to 2003 being revised upward but the impact on more recent quarters has been for the growth rates for both export and import numbers to be negatively effected by the subsequent clampdown by customs. Imports of goods and services fell by 0.8 per cent when compared with the previous quarter and rose by 0.3 per cent when compared with the same quarter a year ago. This compares with a rise of 3.1 per cent in the fourth quarter. Imports of goods in volume terms fell slightly by 0.3 per cent, while imports of services fell by 2.6 per cent.

Figure 14

Trade

Growth, 3 month on 3 month a year ago

A breakdown of the exports of goods numbers by area shows that the first quarter slowdown took place largely in exports to outside the EU. Exports of goods to the non-EU fell by 6.3 per cent over the quarter, while exports to the EU only fell by 0.8 per cent. All of this fall in non-EU exports took place in January, while exports bounced back sharply in February and then rose once again in March. The fall in January was of around 17.6 per cent and followed a rise of 11.3 per cent in December. One possibility is that sterling's rise against

the dollar is now impacting on UK companies' international competitiveness but it is hard to explain an abrupt one month fall and then subsequent rebound in terms of this. A more likely explanation is that the decline is linked to seasonal adjustment problems brought on by computerisation at Customs and Excise, which may have meant that exports that would have been in the past assigned to January were on this occasion assigned to December. The monthly figures for April saw a another large rise in export volumes of 1.5 per cent, which seemed to confirm that the underlying pace of export growth remained quite strong.

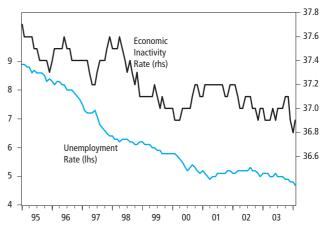

The weak figures for exports for quarter one were not matched by figures from external surveys, which generally pointed to a pickup over the quarter. The BCC survey figures for exports sales and orders for the manufacturing sector reached 7-year highs in 2004 quarter one, building on the strength of quarter four of last year. Service sector export figures, on the other hand, did not match up the strength of the manufacturing sector and were flat on 2003 quarter four levels. The CBI survey also suggests that the export environment improved in the first quarter of the year, especially towards the end of the quarter.

### **Labour Market**

Headline labour market statistics continue to be remarkably stable. Employment is high, with the labour force survey (LFS) employment rate at 74.8 per cent in the three months to April, down marginally on a month ago. Meanwhile the LFS count of employment increased by just over 28,000 over the same period. The ILO unemployment rate was 4.8 per cent in the three months to April, up slightly on a month ago. However, the claimant count unemployment rate, at 2.8 per cent in May was down 0.1 per cent compared with April. All these figures point to a fairly tight labour market but taking into account those people who are officially designated as economically inactive, that is, neither employed nor unemployed but actively seeking work, the position does not look quite so tight (Figure 15).

Figure 15 **Unemployment & Economically Inactive** 

Per cent

Full-time employment has been falling over the last year or so as most job gains have been in part-time work. However in the three months to April the number of full-time workers was up by 3,000, and by 129,000 compared with a year ago. Meanwhile the number working part time was up by 27,000 on the three month period and by 118,000 on the year. This suggests that job gains in these two categories may now be moving much closer together.

Another recent trend has been for job gains to be in self-employment but this may also be changing. The number of self-employed workers in the three months to April fell by 0.5 per cent compared with the previous three months, although it was still up 4.3 per cent compared with a year ago. In contrast the number of employees was up 0.1 per cent on a three month basis and 0.2 per cent on the year.

Average earnings growth fell back in April as bonus related spike in January fell out of the three month figures. In March average earnings including bonuses rose by 5.2 per cent on a three month basis, while in April this figure fell back to 4.3 per cent. Average earnings excluding bonus payments has been more stable, rising by 4.1 per cent in April from 3.9 per cent in the three months to March. This does suggest that the underlying growth of earnings is picking up on the back of a gradual acceleration in private sector earnings. However, the growth rate is still not much higher than a year ago when it was 3.6 per cent and is below the level of two years ago of 4.3 per cent.

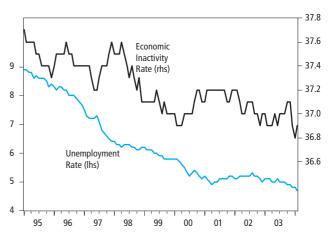

### **Prices**

Most indicators of inflation went up in May, primarily due to the higher oil price. Producer output prices rose by 2.4 per cent annually in May, up from 1.8 per cent in April and 1.6 per cent in March. The increase is primarily due to higher oil prices but also reflects duty increases on alcohol and tobacco. Output prices excluding food, beverages tobacco and petroleum products, rose by 1.4 per cent in May up from 1.3 per cent in April. It seems possible then that underlying inflationary pressures are still being dampened by the strength of sterling. Input prices have climbed sharply in early 2004. These had ended 2003 up 2.1 per cent compared with a year ago. The first two months of 2004 saw falls in input prices in annual terms but since then prices have been climbing and in May input prices were 5.3 per cent higher than a year ago. Most of this rise is due to higher oil prices, as input prices excluding food, beverages tobacco and petroleum products were up only 0.6 per cent on a 12 month basis. It is estimated that about two thirds of the rise in input prices over that period was due to the rise in crude oil prices.

All of the official measures of consumer price inflation continued to point to very low inflation but they nevertheless all went up in May due at least in part to higher petrol prices. Inflation as measured by the consumer prices index (CPI), rose by 0.3 per cent to 1.5 per cent in May compared to 1.2 per cent in April. The new target for the Bank of England from January is to keep CPI inflation (the new term for the Harmonised Index of Consumer Prices) to 2.0 (Figure 16). The old target measure, RPIX, also went up by 0.3 per cent on the month to an annual rate of 2.3 per cent, as did the headline RPI to 2.8 per cent.

Growth, 3 month on a year ago

# Forecasts for the UK economy

A comparison of independent forecasts, June 2004

The tables below are extracted from HM Treasury's Forecasts for the UK Economy and summarise the average and range of independent forecasts for 2004 and 2005, updated monthly.

Independent foreca	asts for 200	4	
	Average	Lowest	Highest
GDP growth (per cent)	3.1	2.3	3.5
Inflation rate (Q4 per cent) CPI RPI	1.6 3.1	0.9 2.3	2.0 4.1
Unemployment (Q4, million)	0.86	0.71	1.09
Current account (£ billion)	-27.3	-38.0	-17.5
Public Sector Net Borrowing (2004–05, £ billion)	36.0	24.2	48.0

Independent fored	asts for 20	05	
	Average	Lowest	Highest
GDP growth (per cent)	2.6	0.5	3.2
Inflation rate (Q4 per cent)  CPI  RPI	1.9 2.8	1.5 2.0	2.9 3.9
Unemployment (Q4, million)	0.87	0.62	1.12
Current account (£ billion)	-28.3	-46.0	-10.0
Public Sector Net Borrowing (2005–06, £ billion)	36.7	24.0	55.0

NOTE Forecasts for the UK Economy gives more detailed forecasts, covering 27 variables and is published monthly by HM Treasury, available on annual subscription, price £75. Subscription enquiries should be addressed to Claire Coast-Smith, Public Enquiry Unit 2/S2, HM Treasury, 1 Horse Guards Road, London, SW1A 2HQ (tel 020 7270 4558). # International economic indicators July 2004

### **Richard Wild**

Office for National Statistics

### **Overview**

- Revised GDP growth estimates for 2004 Q1 now available for all major economies. Japan and the US achieved the equal fastest rate of expansion, followed by France, Italy and Germany.
- Japanese growth in quarter one, where the economy expanded by 1.5 per cent on the previous period, was notably strong. The US economy also performed well, expanding by 1.0<sup>10</sup> per cent. The major Eurozone economies showed some improvement, with France growing by 0.8 per cent in the same quarter, and Germany and Italy both growing by 0.4 per cent.
- The US recovery last year was led primarily by buoyant private consumption demand, and this component continues to be the main driver this year. Fixed investment has also shown increasing strength. The trade deficit, however, remains historically large.
- Japanese growth has again resulted from a balanced combination of both domestic and foreign trade components. Deflation, however, has been a salient price characteristic and real GDP growth in quarter one is explained partly by falls in the GDP deflator.
- The recovery in the Eurozone economies is now confirmed. Output growth in Germany came mainly from an improvement in the trade balance whilst private consumption weakened. Conversely, French growth was led by private consumption whilst the trade balance remained negative. Expansion in Italy resulted from equal contributions from private consumption and investment.
- In 2004 Q1, annual industrial production growth was positive for all countries except in Italy, where growth was flat. External indicators for manufacturing in the Eurozone<sup>1,2,5,6</sup> this quarter have improved in France and Italy but continue to be mixed in Germany. The latest Purchasing Managers' Indices for services rose in all the major Eurozone economies. In the US, the ISM manufacturing<sup>11</sup> and non-manufacturing (services)<sup>12</sup> Purchasing Managers' Indices indicate sustained high levels of activity, although the non-manufacturing index has marginally fallen since April.
- The Italian unemployment rate looks to have levelled out at 8.5 per cent and the French and German rates are broadly flat at 9.3 and a historically-revised 9.8 per cent, respectively. US unemployment is currently below last year's average of 6.0 per cent, at 5.6 per cent whilst the rate is unchanged on March at 4.7 per cent in Japan, a figure still in excess of historical norms.
- Global inflationary pressures remain subdued. Consumer price inflation in France and Italy is close to the ECB target of 2 per cent, but considerably lower in Germany. In that group, producer price growth has been positive but distinctly more sluggish. In the US, both consumer and producer price growth have picked up on last year. New monthly data for Japan indicate further falls in the CPI, but a welcome increase in the PPI.

### **Germany**

Preliminary GDP data for the first quarter of 2004 have now been fully adjusted for seasonal and calendar effects, allowing for a more detailed analysis of the various components of aggregate demand. The quarterly figures for 2003 indicate consecutive falls in GDP of 0.2 per cent in quarters one and two, counterbalanced by growth of 0.2 per cent and 0.3 per cent in quarters three and four. The revival continued into the first quarter of this year, with an addition of 0.4 per cent to GDP. In annual terms, GDP grew by 0.1 per cent in 2003 Q4, followed by a rise of 0.7 per cent in the next quarter, signalling the end of the brief recession. However, this gain is almost entirely attributable to the marked reversal in Germany's net trade position. In 2004 Q1 net exports contributed 1.3 per cent to growth, having subtracted 0.4 per cent in the previous quarter. Excluding 2003, this component has made positive annual contributions in each of the last four years. Domestically, household consumption remains weak, subtracting 0.5 per cent annually in quarter one of this year. Investment has been in decline since 2000 and the trend has continued into this year with a negative input of 0.2 per cent in Q1. Inventories added 0.2 per cent to growth in the same period, having added 0.6 per cent in 2003. Government expenditure also made a modest positive contribution of 0.2 per cent last year, but only had a neutral effect in quarter one of 2004.

In the first quarter of 2004, German GDP increased by 0.4 per cent. Most of this was due to an improvement in the trade balance, which alone would have added 0.8 per cent to the total rise in growth. The only other positive effect came from a more moderate addition of 0.2 per cent from inventories. After falling in all but the first quarter of 2003, private consumption had a neutral effect on growth in 2004 Q1, indicating continued weakness. The figures for investment have been revised, mainly upward. Following negative contributions to GDP expansion of 0.2 per cent in each of quarters one and two of last year, GFCF added 0.0 per cent and 0.3 per cent in quarters three and four. For 2004 Q1, the news is again downbeat, with a real decline of 1.8 per cent resulting in a cut in GDP growth of 0.4 per cent. Lastly, government expenditure subtracted 0.2 per cent from demand, after playing a broadly flat role throughout last year. Overall, it is clear that rapid gains in external demand are masking subdued domestic consumption and declining investment, and this imbalance implies that the expansion may be more fragile than the headline figure suggests.

On the whole, the lack of impetus to current domestic consumption and investment during the course of 2003 has not yet been reversed. In the absence of trade, GDP would have contracted by 0.5 per cent in 2004 Q1. The improvement in economic sentiment in 2003 Q4 was reflected in a brief, if relatively substantial boost to investment. After several months of faint and faltering optimism, the key external surveys continue to tell an uncertain story, rooted in worries over rising oil prices and expected interest rate hikes. The ZEW Indicator of Economic Sentiment<sup>1</sup> fell from December 2003 to May of this year. Despite a one-point rise in June to 47.4, sentiment remains overtly pessimistic, although rising industrial production and a positive labour market signal improving perceptions of the current economic situation.

The June IFO business survey,<sup>2</sup> encompassing manufacturing, construction, retailing, and wholesaling continued to decline, following a brief rise in April. As in May, there was a marked divergence between the business climate in East and West Germany, and a drop off in manufacturing employment is seen as the primary cause of the stagnation in domestic demand. Overall, the prospects for a firm recovery continue to be tenuous.

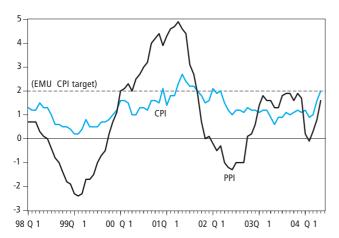

The improvement in net trade in Q1 provided a much-needed boost to the economy, but the growth paths of imports and exports were fairly irregular in 2003, and this volatility suggests that a continuation of the positive trend is by no means certain for Q2. Nevertheless, the dual evidence of expansion in France and Italy, coupled with the decline in the real effective exchange rate since January, continue to offer encouraging signs for external commerce. The idling domestic situation is at least in part explained by government expenditure, whose contribution to GDP growth turned negative last quarter. This is unsurprising, given that ratio of the government deficit to GDP contravened the 3 per cent ceiling imposed by the Stability and Growth pact for the second year in succession in 2003. Under this structural limitation, it seems likely that alternative cyclical and external factors will have to be relied upon to foster an increase in demand.

Industrial production has now risen for three consecutive quarters, providing growing evidence of a cyclical upturn. Industrial production in 2003 quarter four rose at its fastest rate since 2002 quarter three, expanding by 2.0 per cent over the previous period. This compares to a sharp slowdown of −1.1 per cent in quarter two, followed by a very modest 0.1 per cent in quarter three. For the first time since January of this year, the monthly figure in April showed a significant production gain of 2.2 per cent on the previous period, although this way of measuring growth is notoriously volatile. After strong annual growth in December 2003 of 2.7 per cent, the Index of Production fell back to 2.2 per cent in January and 1.6 per cent in February. After a further decline to 1.3 per cent in March, the index grew by 4.0 per cent in April. Generally, industrial production has been weak since 2001, after exceptional gains in 2000. After respective changes of -1.0 per cent and +0.4 per cent in 2002 and 2003, 2004 may offer additional growth if export demand continues to make up for weak private consumption.

Inflation was stable yet subdued in 2003, having fallen below the Eurozone target rate of 2.0 per cent since 2002 Q1 (see Figure 1). In 2004 Q1, the German CPI rose by 1.0 per cent, equalling the annual rate posted for the previous year as a whole. Between July 2003 and March 2004, monthly annual inflation averaged a little less than 1.1 per cent. However, in April growth climbed to 1.6 percent, followed by a further rise of 2.03 per cent in May. Rising oil costs, healthcare reforms and increased tax on tobacco products have driven this upward trend.3 A more subdued increase is observable in the PPI (Figure 1). Prices at the factory gate averaged monthly annual increases of 1.8 per cent from July to December 2003, but inflation dwindled to -0.1 per cent in January. After picking up to 0.3 per cent in March, German producer prices rose by 0.84 per cent and 1.64 per cent in April and May. Oil and fuel prices remain the main cause of the increases.

Figure 1 **Germany: Prices** 

CPI and PPI annual inflation

Some significant upward revisions have been made to the unemployment rate figures, amounting to approximately 0.4 per cent per month since 2003. The monthly figures now average around 9.7 per cent between May and December of last year, with the flat trend continuing into 2004. In January, a rate of 9.6 per cent was followed by two successive postings of 9.7 per cent in February and March. The figure crept up slightly to 9.8 per cent in April, matching that of May last year. Annual employment growth declined in every quarter from 2001 Q4 to 2003 Q4, with particularly strong falls seen in the first half of 2003, but a rise of 0.1 per cent is now shown for 2004 Q1. In quarterly terms, there was a positive change in employment of 0.4 per cent from 2003 quarter two to quarter three, and of 0.6 per cent from quarters three to four. In line with seasonal trends, employment fell by 1.8 per cent in the first quarter of this year, although this decline is less marked than in the first quarters of 2001 and 2002.

The annual growth in earnings of 2.2 per cent in 2004 Q1 is a little higher than the 2.0 per cent rate posted in quarters three and four of 2003. Earnings grew more strongly in the first half of 2003, up by 2.7 and 2.8 per cent in quarters one and two, which helped to boost the annual average to a respectable 2.5 per cent. Wages and salaries have now outstripped CPI inflation in every year since 1999, with the exception of 2001.

### **France**

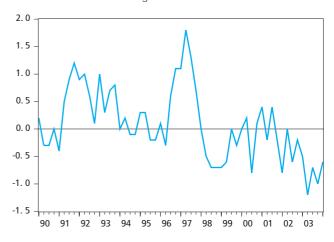

GDP growth accelerated sharply to 1.7 per cent in the year to March 2004, outpacing annual growth in 2003 of 0.5 per cent. Earlier estimates put annual growth in 2003 at just 0.1 per cent. Growth in 2003 was supported by increases in household consumption and government expenditure, which added 0.9 and 0.6 per cent to growth respectively. Conversely, net exports and inventories declined, subtracting –0.9 and –0.2 per cent from growth respectively. Revisions to net exports now show a contraction in exports of 0.8 per cent and an expansion of 0.1 per cent in imports. An upward revision to investment indicates that it made only a flat contribution to the change in GDP in Q1. The similarity between the current French and German economic situations remains, albeit with more robust household consumption in the former. The recent upward revisions to the German unemployment rate

also place a margin of extra distance between the two. The decline in inventories over the first three quarters of 2003 is consistent with strong domestic demand; their subsequent rise in 2003 Q4 and 2004 Q1 in the face of sustained consumption growth may be explained by concurrent increases in industrial production.

The latest national accounts figures (previous figure) indicate that the economy grew annually by 0.4 per cent (0.3 per cent) in quarter three and 1.1 per cent (1.2 per cent) in quarter four, a rapid improvement over the first half of the year. In 2004 Q1, the expansion continued apace, with an increase of 1.7 per cent – a growth rate over twice as fast as in either Germany or Italy. The components in order of the magnitude of their growth impact were household current consumption, government current consumption and fixed investment. France's net export position has been improving recently, although its growth contribution remains close to recent historical lows, at -0.6 per cent (see Figure 2). In quarterly terms, a moderate increase of 0.1 per cent in 2003 Q1 preceded a contraction of 0.3 per cent in Q2. In the latter half of last year, output climbed by 0.6 per cent in quarters three and four. In 2004 Q1, a gain of 0.8 per cent was made. The contribution of household consumption growth to output gains now appears to have been even stronger than earlier estimated for 2003, with the component adding 0.3 per cent in 2003 Q4. The addition of 0.6 per cent in 2004 Q1 remains the largest single contribution to expansion. The moderate rise in government expenditure is now more balanced due to secondary revisions, adding between 0.1 and 0.2 per cent to the change in output in all quarters of 2003, and 0.1 per cent in 2004 Q1. Investment had the second largest impact on the rise in GDP, adding 0.3 per cent, while inventory changes had no effect. Finally, net foreign trade pulled growth down by 0.1 per cent; both imports and exports decelerated in comparison to 2003 Q4, but imports continue to rise more rapidly.

Figure 2 France: Net exports

Contributions to annual charges in GDP

The expansion in demand has now been gathering pace for three quarters. France's economic progress has generally been better than that of the other EU 15 members. In the recent past it has been helped by tax cuts, which have underpinned rises in disposable income and consequently consumer spending.

As such, there is a potential for the recent expansion to slow, as the increase in consumption may have been a one-off event. Preliminary estimates of GDP and its components in Q2 of this year should be available in time for the August publication.

French industrial production expanded by 0.7 per cent in each of the latter two quarters of 2003, on a quarterly basis. A less substantial gain of 0.3 per cent was recorded for 2004 Q1, completing the first sequence of three successive production increases for three years. The latest monthly data indicate a rise over the year to March 2004 of 1.2 per cent, after a minor 0.1 per cent contraction in January and a 0.9 per cent gain in February. The longer-term picture shows that industrial production has been weak for roughly three years, but now appears to be picking up. Production grew by 1.0 per cent in 2001 (a modest performance when compared to growth in 1999 and 2000) and fell by 1.2 and 0.1 per cent in 2002 and 2003, respectively. The strength shown last quarter of last year, with annual growth of 1.2 per cent, carried over into 2004 Q1, where production increased by 0.7 per cent. Solid private domestic demand and renewed export growth may serve to maintain its buoyancy further into the year.

Looking at market indicators, the INSEE monthly business survey<sup>5</sup> for June shows that activity remains above its long-term level, although the composite index has changed little since May. After a slight slowdown over the last three months, the outlook for the ensuing three-month period suggests a subdued recovery, with export order books filling up.<sup>5</sup> The Purchasing Managers' Index (PMI) for manufacturing<sup>6</sup> in France between May and April indicated a 2 point rise in activity, and for this month was accompanied by an even greater 3.5 point rise in the services index.<sup>6</sup> The general outlook would now appear to have moved into line with the story told by the official output data.

Consumer price inflation in France has picked up pace fairly rapidly during recent months. Following an acceleration to 2.3 per cent in November 2003, price growth fell back to 2.0 per cent in January of this year, and 1.7 per cent in February and March. Price growth rose to an annual rate of 2.1 per cent in April. As for all economies, the main catalyst of the rise was surging oil and fuel prices and this factor remained key in May as a hike in energy costs pushed annual inflation up to 2.6 per cent.<sup>7</sup>

Producer prices have also risen during 2004, but so far to a much lesser degree. After remaining broadly flat from July to December last year, annual price growth rose by 0.1 per cent each month from the January rate of 0.1 per cent to the April figure of 0.4 per cent. Whilst these figures are low – quarterly annual PPI inflation was 0.6 per cent as recently as 2003 Q1 and Q2 – they show a clear upward trend, resulting from increases in the cost of oil and its derivative products.

The French unemployment rate rose steadily over the past year, from 9.1 per cent in January 2003 to 9.5 per cent in September through to February, the highest rate since April 2000. In March and April, the rate fell marginally to 9.4 per cent. Employment growth has shown a steady decline since 2000 Q4 on an annual basis. Using the more volatile quarter on quarter measure, the increase in the number of people employed has been declining since 2000 Q1, settling at around

0.1 per cent during 2002. Data for 2003 show negative growth of 0.3 per cent in quarter one and 0.1 per cent in each of quarters two and three, with zero growth in quarter four. Estimates for 2004 Q1 again show no change, with a rise in service sector employment cancelled out by a fall in the manufacturing sector.<sup>8</sup>

Annual earnings growth has been easing since 2000 and declined from 5.2 per cent in 2000 Q2 to 2.6 per cent in the second quarter of 2003. Increases in quarters three and four were moderate, at 2.9 per cent and 2.7 per cent, respectively.

### Italy

The preliminary estimates for the components of GDP for 2004 Q1 are currently available from the Italian Statistical Office. However, due to the incomplete nature of the available data, it was not possible to present information concerning the contribution of the components of GDP on an annual basis.

Expenditure data for 2003 now indicate that the Italian economy expanded by 0.4 per cent last year. The first half of the year was characterised by slightly negative growth, which was followed by quite a strong upturn in activity in quarter three and no growth in quarter four. Annual growth in 2004 Q1 is estimated to be 0.8 per cent. The main contributors to the increase in 2003 were household and government consumption, which added 0.7 per cent and 0.4 per cent to GDP growth, respectively, and rising stocks, which added 0.6 per cent. Fixed investment was comparatively weak during 2003, falling by 2.1 per cent on the previous year, to have a negative impact on output growth of 0.5 per cent. Italy's net foreign trade position marginally improved, with a slight fall in exports more than offset by a fall in imports. However, the weakness of exports since 2002 resulted in a contribution of −0.9 per cent to GDP growth in 2003.

The first quarter of 2004 displayed a welcome rise in activity, with expenditure increasing by 0.4 per cent. The main drivers of the expansion were household consumption and investment, which each added 0.5° per cent to GDP growth, on a quarterly basis. Investment grew by a notable 2.5° per cent in the year to March. Government consumption made a flat contribution, having marginally fallen since 2003 Q4, whilst inventories subtracted 0.4° per cent. Externally, export demand dropped by 2.1° per cent, resulting in a reduction in overall demand of 0.6° per cent. However, this effect was partially offset by a concurrent fall in imports that resulted in a combined contribution to GDP growth from net exports of -0.2° per cent.

Household consumption appears to have rebounded after adding 0.2, 0.0 and 0.2 per cent respectively to growth in the first three quarters of the year, and subtracting 0.2 per cent in the final quarter. Much the same pattern was shown by investment, which fell sharply in 2003 Q1, and continued to stifle the expansion for the remaining three quarters. Net exports followed a similar path to Germany and France. In particular, trade only added to growth in quarter three of 2003. That one-off pickup seems to have been linked to improving global economic conditions and increasing demand, especially outside of the Eurozone. In 2003, inventories proved to be the main catalyst of growth -

especially in quarter one, where they contributed 0.7 per cent and in quarter four, where a further 0.6 per cent was added. Rising household consumption in tandem with falling import demand may explain the destocking that occurred in 2004 Q1.

The Index of Production has, in general, been weak since 2001 (see Figure 3). The latest estimates place annual growth in January 2004 at 0.1 per cent, followed by a no growth in February. Production fell by 0.2 per cent in March but rebounded 0.7 per cent in April. However, the month-onmonth figures indicate an overall contraction in production in the first three months of the year. Beyond this, the Purchasing Managers' Index for manufacturing<sup>6</sup> improved marginally between May and June by 0.3 points,<sup>6</sup> following a moderate rise in the previous month. The corresponding services index showed a greater rise of 1.1 points in June.<sup>6</sup> The output position therefore seems to be moderately positive, and rising French and German GDP may help to generate further demand and optimism for the future.

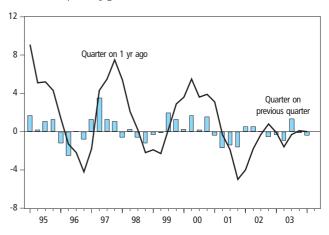

Consumer price inflation in recent years has been consistently higher than the EU average, with the most recent data for 2004 quarter one indicating a price increase of 2.2 per cent. From January to October 2003 inflation ranged between 2.6 and 2.8 per cent. As in France, the effect of the summer heatwave on agricultural prices kept inflation high over the year. In November, inflation slowed to 2.5 per cent and remained at that level in December. In 2004, price rises slowed marginally, to 2.2 per cent in January and to 2.3 per cent in February, March and now April. The increase in household consumption in Q1 may generate some extra inflationary pressure. Producer price inflation has been weaker than consumer price inflation since 2000. In the first quarter of this year, producer prices grew 0.4 per cent on an annual basis. PPI growth slowed through 2003, from 2.8 per cent in February to 0.7 per cent in December. It declined even further in January 2004, increasing by only 0.4 per cent. However, after bottoming out at 0.1 per cent in February, prices picked up by 0.7 per cent in March and 1.8 per cent in April again, rising oil costs may feed drive PPI inflation higher into the year.

The unemployment rate in Italy has been declining steadily since 1998 when it peaked at 11.7 per cent. The rate was broadly flat at 9.0 per cent in 2002 but declined steadily in 2003 going from 9.0 per cent in January to 8.5 per cent in September. The latest figures indicate that unemployment remained steady at this level up to January. Data for later months is still unavailable. Annual employment growth has been positive in every quarter of the last nine years. Growth rates for 2003 were slightly weaker than those observed in 2001 and 2002, with the most recent data for 2004 Q1 showing a relatively small rise of 0.7 per cent. Looking at quarterly growth, the fall of 0.6 per cent in the same period appears to fit into the midrange of the seasonal declines commonly observed over the last five years. As such, it would be imprudent to interpret this as an indicator of a new downward trend in employment.

Earnings figures are quite volatile. It is worth noting however that annual increases for July, August and September 2003 were all 3.2 per cent, regaining the positive momentum that had been lost between March and June. The annual growth rate then fell back slightly towards year-

Figure 3 **Italy: Industrial production** 

Annual and quarterly growth of the IoP

end, posting 2.7 per cent in each month from October to December. The most recent data show rising earnings growth of 2.5 per cent, 3.4 per cent and 3.5 per cent, respectively, in January, February and March. In April, the rate climbed to a twelve-month high of 3.6 per cent, and earnings growth is now considerably greater than CPI inflation. Earnings in 2003 overall increased by 2.5 per cent, and in the year to 2004 Q1, rose by 3.1 per cent.

### **USA**

The final estimate of GDP for 2004 Q1 is now available, although it has yet to be incorporated into the OECD tables presented here. The US economy grew by 3.1 per cent in 2003, outstripping all other major world economies. It recovered strongly last year, expanding in all quarters and showing particular buoyancy in the second half of the year. Recent estimates of output in 2004 Q1 confirm that the upward trend has been sustained thus far, with annual growth of 4.8 per cent.<sup>10</sup> Surveys of business activity in May continue to be favourable. The latest Institute for Supply Management manufacturing (diffusion) index rose marginally to 62.4 per cent in April,<sup>11</sup> close to recent highs. A record posting for employment more than offset slight falls in new orders and production.<sup>11</sup> The corresponding non-manufacturing index grew even further, posting  $65.2^{12}$  per cent, down from  $68.4^{12}$ per cent in April. Nevertheless, this represented the fourteenth consecutive month of growth.

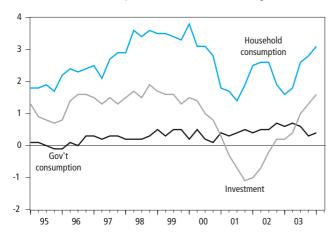

The main factor driving output expansion in 2004 Q1 was private consumption expenditure, which contributed 3.1<sup>10</sup> per cent to growth, annually (see Figure 4). Within private consumption, contributions to growth came primarily from services and to a lesser degree from non-durable goods, with large fluctuations in expenditure on durable goods. Fixed investment was the second largest contributor, adding 1.4<sup>10</sup> per cent (Figure 4), with sustained large increases in expenditure on equipment and software and information processing equipment. Government expenditure also made a sizeable contribution of 0.5<sup>10</sup> per cent (Figure 4), partly due to higher defence spending. Inventories added 0.2<sup>10</sup> per cent to the gain in GDP, and net exports subtracted 0.4<sup>10</sup> per cent. Overall, the data for 2003 indicated that the US economy

was rebounding rapidly, with investment finally recovering and consumer confidence at high levels. Non-farm payroll employment has also risen significantly over the last six months, as indicated in the ISM surveys. The trade deficit remains very high, and the recent rise in interest rates may exacerbate this if the dollar appreciates, although there may be a reverse effect if domestic consumption is curtailed.

Figure 4

USA: Domestic demand

Contributions of consumption and investment to GDP growth

The quarterly expansion in 2004 Q1 was strong (1.0 per cent<sup>10</sup>), equalling the rate of increase observed in the previous period. Consumption growth added 0.7<sup>10</sup> per cent to the gain in output, slightly higher than the previous contribution of 0.6 per cent. Fixed investment contributed 0.2<sup>10</sup> per cent, mainly attributable to non-residential investment. Government consumption made a minor addition of 0.1 per cent after a neutral contribution in 2003 Q4, and the contribution from inventories amounted to +0.2 per cent. Finally, net exports had a negative impact on growth of 0.2<sup>10</sup> per cent after final revisions to the data. Overall, sustained domestic strength, led by strong private consumption, continues to outweigh the drag effected by net trade.

The index of production displayed signs of rapid expansion in the second half of 2003, with further minor revisions to the data this month. In annual terms, after a decline of 1.0 per cent in 2003 quarter two, the IOP picked up in the third quarter when it grew by 1.0 per cent and was even stronger in quarter four, rising by 1.4 per cent. The index increased more rapidly in 2004 quarter one, posting 1.6 per cent. Monthly, the trend of increasing strength continues, with annual growth rates of 2.4, 2.7 and 3.4 per cent in January, February and March, respectively. The latest April figure shows even greater growth of +4.9 per cent. Overall in 2003 the index grew by 0.3 per cent, following on from two consecutive years of contractions, and the annual rate of expansion in the year to 2004 quarter one is currently estimated at 2.9 per cent – the highest figure in the last three years.

In the first quarter of this year, consumer prices rose annually by 1.7 per cent. Inflation had picked up slightly in the first few months of 2003 and reached a peak for the year to March when the rate hit 3.1 per cent. Much of this can be explained by fluctuations in the oil price and after this peak, inflation

averaged 2.1 per cent between April and December. In January, consumer prices grew by 1.9 and then by 1.7 per cent in both February and March. After a marked increase to 2.3 per cent in April, new data for May indicate an even greater jump to +3.1<sup>13</sup> per cent. Rising energy costs and the costs of related services were the main drivers of the upswing. The change in the growth rate of producer prices followed a similar pattern to consumer price growth but have been much more volatile, posting a respectable annual growth rate of 1.5 per cent in 2004 quarter one. PPI inflation fell from a peak of 4.5 per cent in March 2003 to 1.1 per cent in March 2004, but since then pulled up sharply to +4.0 per cent in April. On a month-to-month basis, inflation accelerated from 0.7<sup>14</sup> per cent in April to 0.8<sup>14</sup> per cent in May, prompted by increasing prices for finished consumer foods and energy goods. <sup>14</sup>

Unemployment appears to have settled at 5.6 per cent, on average, for the first five months of 2004. In broad terms, the rate had risen since 2000 when it hit 4 per cent, reaching a peak of 6.0 per cent in 2003. The fall in the rate during the last twelve months suggests that the recovery is accompanied by an improvement in the labour market, and worries about weak growth have been abated by data from the household employment survey. After a contraction in month-on-month employment growth in January of 1.2 per cent, growth was +0.4 per cent in February and +0.2 per cent in March. In April and May, employment grew by 0.5 per cent and 0.4 per cent, respectively. Quarter-on-quarter growth in the second half of the year had shown a similar picture, rising by 0.3 and 0.4 per cent in the third and fourth quarters respectively; the recorded fall of 1.0 per cent in 2004 Q1 seems to be seasonal rather than cyclical. In the year to 2004 quarter one, employment grew by 0.6 per cent, compared to a rise of 1.0 per cent over the same period a year earlier.

Earnings growth had been very stable in the months up to September 2003, hovering around 3.2 and 3.3 per cent, at a similar level to annual growth rates posted in 2001 and 2002. Earnings growth seems to have slowed since quarter three, however, with the index rising at the annual rate of 2.4 in all months from October 2003 to May 2004. This rate may lower the average annual rate of growth below 3.0 per cent for the first time in four years unless the tightening of the labour market brings about renewed wage pressure.

### **Japan**

Preliminary estimates of GDP for the first quarter of this year became available in mid-May, with the release also containing some past revisions. On an annual basis, expenditure is estimated to risen by a rapid 5.0 per cent in the year to 2004 Q1, on the back of 2.5 per cent growth during 2003 as a whole. With the exception of 2000, output growth over the last few years has been prominently sluggish in the world's second largest economy, but the recent figure places Japan's expansion far ahead of the eurozone, and equal to that of the US. The majority of gains in 2004 Q1 came from increases in domestic demand, but investment and foreign trade also boosted growth. It should be noted, however, that due to price deflation, the real rate of growth has been above the nominal rate for a number of years. Nevertheless, the economic expansion over the last two years has been important to the world economy.

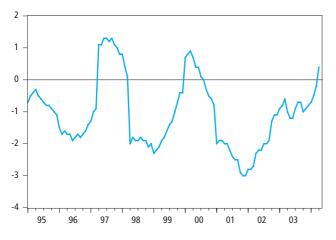

On a quarterly basis, the expansion in 2004 Q1 was domestically generated, chiefly by private demand and inventories, which each contributed 0.5 per cent to growth. Investment added 0.2 per cent to growth, whilst government consumption contributed a more modest 0.1 per cent. Externally, net exports raised output growth by 0.2 per cent, 0.2 per cent less than in the previous quarter. Annual growth in 2004 Q1 was secured through a contribution of +1.6 per cent from private consumption and a similar addition of 1.5 per cent from investment. Inventories and government consumption added 0.5 per cent and 0.2 per cent, respectively and net trade boosted growth by a healthy 0.9 per cent.

As with all the other major economies outside the UK, the index of production contracted in 2003 quarter two by 0.7 per cent, having grown by 0.3 per cent in the previous quarter. The index, however, saw a rebound in quarter three when it grew by 0.9 per cent and grew rapidly in quarter four, when it registered a gain of 3.6 per cent. Looking at the annual change in monthly terms, a substantial amount of growth occurred between September 2003 and January 2004, averaging 4.2 per annually (see Figure 5). In February, the index rose by a lesser 3.3 per cent, followed by faster growth of 4.0 per cent in March. The month-on-month figures, although intrinsically more volatile, tell a slightly different story. After a strong boost of 3.8 per cent in September last year, production slowed and then fell in December. After rebounding in January, the data for February indicate a contraction of 4.0 per cent, partly compensated for by a March increase of 0.9 per cent. Even taking month-to-month volatility into account, Japanese industrial production is the least stable of the major economies analysed here. In 2003, the index rose by 3.1 per cent, a minor improvement over the previous year's fall of 1.2 per cent, and a notable improvement on 2002's fall of 6.0 per cent. In summary, industrial production growth in Japan has been somewhat erratic over the past five years, but the gains in 2003 and early 2004 have so far been greater than the losses.

Figure 5

Japan: Producer prices

Growth, month on corresponding month one year ago

Quarterly consumer and producer prices continue to deflate, albeit at a decreasing pace than in 2001 and 2002. Consumer prices only fell by 0.2 per cent in 2003, the lowest reduction in several years; PPI deflation also relented somewhat, with

prices dropping by 0.9 per cent on the previous year. These figures compare to -1.0 and -2.0 per cent respectively in 2002. However, the latest data for 2004 are mixed. Following the March fall of 0.1 per cent, consumer prices fell by 0.4 per cent in April despite having fallen in the same period a year ago. For producer prices using the same measure, a January fall of 0.7 per cent preceded a lesser fall of 0.5 per cent in February and a year low of -0.2 per cent in March. But for the first time since August 2000, PPI growth was positive in April at 0.4 per cent (see Figure 5). If high domestic demand is maintained over the course of the year, a move into positive consumer price growth still remains possible.

The unemployment rate in April 2004 was 4.7 per cent, equal to the figure posted in March, and marginally lower than the January and February figure of 5.0 per cent. Unemployment declined slightly in 2003 as a whole (to 5.3 per cent, down from 5.4 per cent in 2002) and the current rate of unemployment looks to have moved closer to Japanese historical standards, although it is still relatively high. The previous three years' rates are in fact unprecedented since 1960 when OECD records began. From 1999 to 2003, the number of people employed fell in every year. In 2003, employment growth had picked up towards the end of the second quarter but seemed to revert back to declines since then, falling in all months from July 2003 to the February figure of -0.2 per cent, on a month-to-month measurement. However, the number of people in work rose by 1.0 per cent in March and a further 1.2 per cent in April. In the year to 2004 Q1 employment increased by 0.3 per cent compared to a drop of 0.8 per cent in the same period a year ago.

Despite slackness in the labour market, there was a positive earnings trend for 2003 in all periods, with an increase of 2.2 per cent for the year as a whole, and of 1.7 per cent annually in 2004 Q1. Last year saw growth of 1.8 per cent in quarter one, and 2.6 per cent in quarter two. Further rises of 2.4 per cent were seen in both quarters three and four. The monthly data show particularly strong rates of annual growth in 2003 for both July (4.7 per cent) and December (4.2 per cent). The growth for this year is weaker, yet still positive, with a January rise of 1.6 per cent, followed by a further rise of 2.0 per cent in February. In March, earnings grew by a respectable 1.7 per cent, although the increase in April was relatively weak at 0.7 per cent. Overall, the labour market has tightened over the last year, and although earnings growth has been volatile (potentially due to bonuses), it has been positive, albeit less so than in 2002.

# Regional Gross Value Added

### **John Marais**

Office for National Statistics

This article presents the latest estimates of regional (NUTS1) Gross Value Added (GVA) at current basic prices for 2002, and revisions for the period 1989 to 2001 first published in Office for National Statistics (ONS) News Releases on 14 August and 20 August 2003. These estimates are consistent with the estimates of UK GVA published in the 2003 edition of United Kingdom National Accounts –The Blue Book .1

The headline estimates that are presented are a moving average based trend of the unadjusted estimates for each region. These adjusted series remove some year to year volatility in the unadjusted series.

The revised estimates for 2002 show that:

- Growth in total GVA, compared to 2001, was largest in the South West, Northern Ireland, and the North West. The regions with the smallest growth in 2002 compared to 2001 were London and Scotland.
- GVA per head of population was greatest in London, the South East and the East of England, and these were the only regions with a GVA per head above the UK average. The North East and Wales had the lowest GVA per head in 2002.

### Introduction

This article contains a more detailed explanation of the material included in the 30 April 2004 News Release of estimates of UK regional (NUTS1) Gross Value Added (GVA) at current basic prices for 1989 to 2002 (see Appendix A, paragraph 4 for explanation of NUTS areas).

This article primarily focuses on revisions to regional GVA estimates against those published in August 2003.

Regional GVA estimates are calculated according to the income approach, and are consistent with the European System of Accounts 1995.<sup>2</sup> Due to the absence of Inland Revenue regional data on wages and salaries, the estimates for 1997 to 2002 are marked as provisional. A glossary of abbreviations is given in Appendix B. The article is divided into the following parts:

### **Headlines (2002 estimates)**

### **GVA** by region

- In 2002, the region with the largest GVA was the South East, with 16.4 per cent of total UK GVA excluding Extra-Regio.
- Northern Ireland had the smallest share, at 2.3 per cent.

### **Growth in total GVA**

- UK total GVA grew by 5.1 per cent in 2002 compared to 2001; UK total GVA excluding Extra-Regio grew by 5.1 per cent.
- Total GVA increased in all the UK regions in 2002 compared to 2001, although there was variation in the rate of increase.
- The greatest growth was in the South West: 6 per cent higher than in 2001.
- All regions except Yorkshire and the Humber, West Midlands, London and Scotland had a growth rate above the UK average excluding Extra-Regio.
- The smallest GVA growth in 2002 was for London: up 4.4 per cent compared to the previous year.

### **GVA** per head of population

- In 2002, GVA per head was £15,259 for the UK as a whole (excluding Extra-Regio).
- London had the largest GVA per head, £19,975, which was 31 per cent above the UK average.

Table A Regional GVA 2002<sup>1,2,3</sup>

Region	Total (£bn)	Share of UK (per cent)	Growth on 2001 (per cent)	Per head (£)	Per head index (UK = 100)
United Kingdom <sup>4</sup>	903.8	100.0	5.1	15,300	100.0
North East	29.5	3.3	5.3	11,800	77.0
North West	93.1	10.3	5.4	13,800	90.1
Yorkshire & the Humber	65.7	7.3	4.9	13,200	86.4
East Midlands	59.1	6.5	5.1	14,000	91.8
West Midlands	72.9	8.1	4.8	13,800	90.1
East of England	91.0	10.1	5.3	16,800	110.0
London	146.9	16.3	4.4	20,000	130.9
South East	147.8	16.4	5.2	18,400	120.5
South West	69.2	7.7	6.0	13,900	91.4
England	775.3	85.8	5.1	15,600	102.5
Wales	35.1	3.9	5.2	12,000	78.8
Scotland	73.0	8.1	4.8	14,400	94.6
Northern Ireland	20.5	2.3	5.6	12,100	79.2

<sup>1.</sup>GVA at current basic prices.

The GVA for Extra-Regio comprises compensation of employees and gross operating surplus which cannot be assigned to regions. Including Extra-Regio and statistical discrepancy, UK total GVA was £925.6bn in 2002, an increase of 5.1 per cent on 2001.

- The North East had the lowest GVA per head, at £11,750.
- London, the South East and the East of England were the only regions with a GVA per head of population above the average for the UK.

# Revisions analysis since August 2003 publication

This part of the article compares the current regional GVA estimates for 1989 to 2001 to the latest dataset that was published in August 2003 and subsequently in the October 2003 edition of *Economic Trends*.<sup>3</sup>

The main reasons for revisions since the August 2003 regional GVA publication are:

- revisions to national control totals (Blue Book 2003)
- revisions to data for manufacturing (ABI/2 data)
- revisions to Labour Market data
- revisions to regional population estimates for 2001 consistent with mid-year population estimates as at 27 January 2004.

The effect of these revisions are now discussed below.

### **Revisions to national control totals**

These regional GVA estimates reflect changes to UK national control totals that were published in the 2003 edition of the *UK National Accounts - The Blue Book*.

Blue Book 2003<sup>4</sup> included a number of revisions to UK national controls for all years from 1992 to 2001. The results also reflect new data for 2001 from the ABI, from the Inland Revenue and from the annual International Trade in Services Inquiry (ITIS). Upward revisions have also been made to imports of goods from 1999, reflecting initial adjustments for the impact of VAT Missing Trader Intra-Community fraud.

The different mix of industries in each region means that the revisions to national control totals are not spread uniformly across regions, but have a differential impact. The largest revision to UK total GVA was in 2001. In 2001, the Blue Book revisions have the greatest effect on the total GVA of the South East, the North West and the East of England, leading to increases in GVA of £1.3bn, £1.1bn and £0.9bn respectively. Extra-Regio GVA decreased by £1.6bn.

### Revisions to data for manufacturing (ABI/2 data)

The latest regional estimates of GVA incorporate revisions to Annual Business Inquiry 2 (ABI/2) data. Revisions to ABI/2 data for 1998 to 2000 were published in September 2003, along with data for 2001 for the first time. The 2001 actual data used to produce the revised regional GVA estimates replaces the estimated data used in the August 2003 publication. There were revisions for all manufacturing industries from 1998 to 2001.

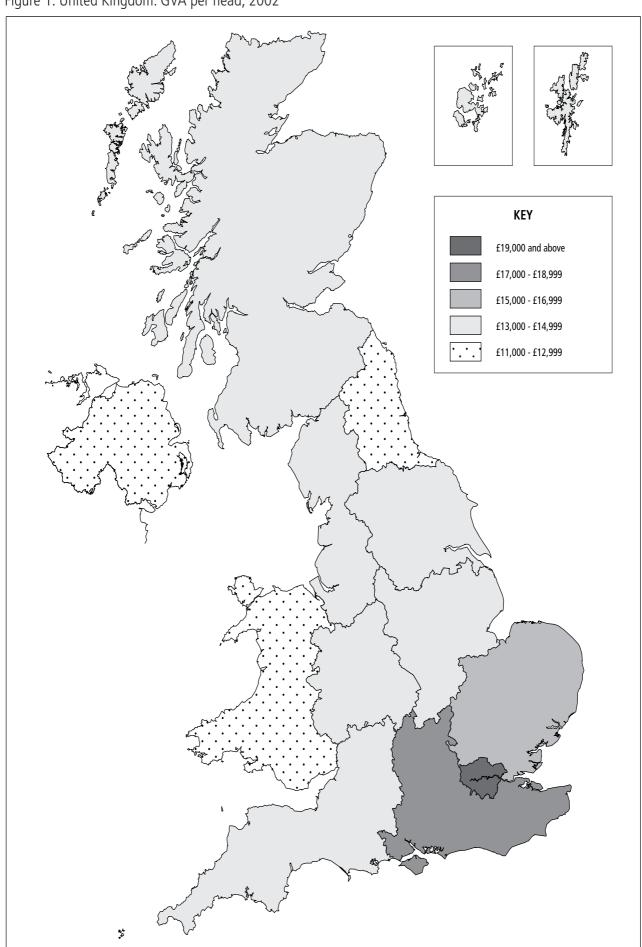

These changes caused revisions in all years, in particular to 2001, where previously ABI/2 data for 2000 were used as estimated data for 2001. The greatest impact of the use of the

<sup>2.</sup> Estimates are on a residence basis.

<sup>3.</sup> Figures may not sum to totals due to rounding

<sup>4.</sup> Excluding Extra-Regio and statistical discrepancy.

Figure 1: United Kingdom: GVA per head, 2002

latest ABI/2 data was seen in Yorkshire and the Humber which was revised upwards by £476m, and the West Midlands which was revised downwards by £344m.

### **Revisions to Labour Market data**

The current set of regional GVA estimates has incorporated revisions to Short-Term Employment Survey (STES) data. Revisions to STES data for 1989 to 2001 were published in April 2004. There were revisions to the UK totals for all industries, but predominantly in the public sector. These revisions have a differential impact on industries and regions across the UK, and have made a significant contribution to the overall revisions to regional GVA estimates. STES data are used together with NES data as an indicator dataset to derive regional and industry estimates of Compensation of Employees (CoE) for non-manufacturing industries.

The greatest effect of these revisions in 2001 was to London, for which total GVA decreased by £410m and Yorkshire and the Humber, where GVA decreased by £327m. By contrast, the GVA estimates for the South West and Scotland was revised upwards as a result of the STES revisions, increasing £251m and £185m respectively.

### **Revisions to 2001 population estimates**

Since the publication of regional GVA estimates in August 2003, the ONS population estimates for 2001 have been revised. The revision to the population took account of the work by the ONS to better understand the results of the 2001 Census. The outcome of the work so far has been a revision to the 2001 mid-year population estimates, shown in Table B.

The impact of this work can be seen on the GVA per head and per head index results, particularly for London and the North West. For London, the population estimates for 2001 were increased by 119,905 to 7,307,911, which has the effect of decreasing the GVA per head figure by £321 from £19,587 to £19,265. For the North West, population estimates for 2001 also increased by 35,000 to 6,767,200 reducing the GVA per head from £13,129 to £13,060.

# Overall effect of revisions since August 2003 publication

The effects of the main revisions to regional GVA since the August 2003 dataset are quantified in Appendix A. Despite the fact that there have been a number of revisions to the regional GVA data since the August 2003 publication as described above, the revised regional GVA estimates for 1989 to 2001 presented in this article give a picture of regional GVA similar to the August data.

The most significant revisions between August 2003 and the current data are caused by revisions to the national controls and the main indicator series, STES and ABI/2. The other revisions generally have a smaller impact on total GVA, although again they have been important in terms of giving confidence in the dataset.

### **Future work plans**

Regional GVA estimates for 2003 are due to be published in December 2004, and will take on board the revisions outlined below. Publication of regional GVA is linked to the production of the National Accounts annual Blue Book.

Table B

Changes in mid-year population estimates for 2001 and their impact on GVA per head results in 2001

			GVA per head,	GVA per head,	
	Old mid-year	Current mid-year	using the old	using the revised	
	population	population	population	population	
	estimates	estimates	estimates	estimates	
	2001	2001	(£)	(£)	Difference (£)
United Kingdom <sup>1</sup>	58,838,014	59,050,847	14,618	14,566	-53
North East	2,516,531	2,518,822	11,142	11,132	40

East of England	5,394,860	5,401,270	16,013	15,994	-19
London	7,188,006	7,307,911	19,587	19,265	<del>-3</del> 21
South East	8,006,896	8,021,373	17,550	17,518	-32
South West	4,934,162	4,937,012	13,223	13,216	-8
England	49,181,339	49,389,736	15,000	14,937	-63
Wales	2,903,156	2,907,592	11,488	11,470	48
Scotland	5,064,200	5,064,200	13,748	13,748	0
Northern Ireland	1,689,319	1,689,319	11,492	11,492	0

<sup>1</sup> Excluding Extra Regio.

The Blue Book is generally published six months after the end of the period to which it relates, although the latest year will not be balanced through the supply-use framework. Regional GVA data consistent with the Blue Book national control totals are then published a further six months after the *Blue Book* publication. Blue Book 2004 (that is, with annual data up to 2003) is due to be published at the end of June 2004.

Estimates of sub-regional GVA for 1995 to 2002, giving figures for the UK broken down into the 37 NUTS2 and 133 NUTS3 areas, are also due to be published in December 2004.

### Further work for the 2003 GVA dataset

## Revised Blue Book national controls, and revised ABI/2 data

The following revised datasets will become available between publication of the current regional GVA estimates and the 2003 regional GVA dataset:

- The annual Blue Book will be published at the end of June 2004; this will contain revisions to UK control totals for the income components of GVA.
- Revised ABI/2 data will be published in July 2004 and will be consistent with the data underlying the *Blue Book* publication. The ABI/2 is expected to contain revisions for 2001.

The regional GVA estimates for 2003 which are due to be published in December 2004 will take on board the above revisions.

### Wages and salaries data from Inland Revenue

It was hoped that regional estimates of wages and salaries for the period 1997 to 2001 would be available from Inland Revenue for use in compiling this set of regional GVA data. However, Inland Revenue have identified data quality problems with their regional data. These data have therefore not been used in compiling regional GVA; as for previous regional GVA estimates, 1996 regional compensation of employees (CoE) estimates, based on Inland Revenue data for 1996/97, have been projected forward using information from earnings and employment surveys. The regional GVA production team have begun a piece of work to assess the suitability of Inland Revenue regional information for use in estimating regional GVA. It is hoped that these data will be used for the 2003 regional GVA estimates.

# Plans for further methods and data source improvements

### Further use of ABI/1 and ABI/2 data

Annual Census of Production (ACOP) data have been used to regionally allocate wages and salaries, and gross operating surplus (GOS), for the production industries up to 1997. Service industry national control totals for both of these components were allocated for these years using estimates of wages and salaries derived from the NES and STES, as there

was no equivalent to ACOP for the service industries. The ABI/2 now provides regional data on CoE and proxies for profits for both the production and most service industries from 1998. The regional GVA production team plan to assess the ABI/2 regional service industries data as a possible replacement for the current data sources. It is likely that the ABI/2 results for service industries will need extensive quality assurance before use.

### **Commuting patterns**

Information on commuting patterns is used to derive the workplace-based estimates of regional GVA. When 2001 Census travel-to-work data become available, it is planned to investigate the commuting patterns between regions. The purpose of this proposed work is to test, and if necessary update, the current assumption that the only significant net commuting between NUTS1 regions is between London, the South East and the East of England. It is hoped that investigations will show if and how commuting patterns have changed and determine which regions now experience a significant degree of net commuting.

### **Allsopp Review**

In February 2003 the Chancellor announced a review, to be lead by Christopher Allsopp, which included the following terms of reference: "to deliver an assessment to the Chancellor, the Governor of the Bank of England and the National Statistician, with a first report by the 2003 Pre-Budget Report on .... the regional information and statistical framework needed to support the Government's key objective of promoting economic growth in all regions and reducing the persistent gap in growth rates between the regions...".

The report, *Review of Statistics for Economic Policymaking*<sup>4</sup>, was published on 31 March 2004. The ONS is now considering its response to the review's recommendations.

### **Diversity of the NUTS1 regions**

Scotland, Wales, Northern Ireland and the regions of England are all different in character, industrial structure and economic performance. The table below shows some of the differences. Scotland has the largest area, but has a small population; London has by far the smallest area, but the second largest population – over 7 million. At the other extreme, Northern Ireland has only a population of 1.7 million. These large variations in the regions' populations are reflected in the size of regional GVA and incomes.

The wide variation in the size of the regions makes it difficult to compare the regions' economic performance using cash totals; comparisons are therefore usually expressed in terms of amounts per head of the population. However, it is important to note that the growth in totals may be quite different to the growth per head in regions where the population has increased or decreased. Furthermore, the level per head is determined both by the average amount of cash of the working population and by the proportion of dependants. In Northern Ireland, for example, households have a high proportion of children (25 per cent of the population were aged 16 or under in 2002 compared with 19 to 21 per cent

Table C **Key Regional Statistics – Percentages of the UK** 

		Revised	Total Economically	Gross Value	Individual Consumption	Total Household
	Area	Population <sup>1</sup>	Active	Added <sup>2</sup>	Expenditure	Income <sup>3</sup>

Northern Ireland	5.8	2.9	2.6	2.3	2.4	2.3

<sup>1.</sup> Revised provisional mid-year population estimates based on 2002 Manchester Matching exercise.

in other regions). This will tend to depress amounts per head. Ideally the age structure of the population should therefore be taken into account when comparing figures on a per head basis.

### **Conclusions**

The main conclusions to draw from this article are:

- ONS believes that the current estimates are the best that can be produced with the data and methodology currently employed.
- There have been a number of revisions to regional GVA since the previous published dataset for 1989 to 2001 was published in August 2003. Among these are revisions to population estimates, national controls, STES and ABI/2 data. The revised regional GVA estimates for 1989 to 2001 give a similar picture of regional GVA to the August 2003 data. The regions to see the largest revisions to GVA were the South West and the South East.

<sup>1</sup> The headline regional GVA series for this publication have been calculated

using a five-period moving average.

2 Estimates of regional GVA in this table are on a residence basis, where the income of commuters is allocated to where they live rather than their place of work.

<sup>3</sup> Components may not sum to totals as a result of rounding.
4 Provisional
5 The GVA for Extra-Regio comprises compensation of employees and gross operating surplus which cannot be assigned to regions.

The headline regional GVA series for this publication have been calculated using a five-period moving average.
 Estimates of regional GVA in this table are on a residence basis, where the income of commuters is allocated to where they live rather than their place of work.
 Components may not sum due to rounding.

<sup>4</sup> Provisional
5 Public administration, national defence and compulsory social security.
6 Financial Intermediation Services Indirectly Measured.

The headline regional GVA series for this publication have been calculated using a five-period moving average.
 Estimates of workplace based GVA allocate income to the region in which

Components may not sum to totals as a result of rounding.
 Provisional
 The GVA for Extra-Regio comprises compensation of employees and gross operating surplus which cannot be assigned to regions.

The headline regional GVA series for this publication have been calculated using a five-period moving average.

 Estimates of regional GVA in this table are on a residence basis, where the income of commuters is allocated to where they live rather than their place

of work.

3 Components may not sum to totals as a result of rounding.

4 Provisional

5 The GVA for Extra-Regio comprises compensation of employees and gross operating surplus which cannot be assigned to regions.

<sup>1</sup> The headline regional GVA series for this publication have been calculated using a five-period moving average.

2 Estimates of workplace based GVA allocate income to the region in which

commuters work.

<sup>3</sup> Components may not sum to totals as a result of rounding.

<sup>5</sup> The GVA for Extra-Regio comprises compensation of employees and gross operating surplus which cannot be assigned to regions.

#### Gross Value Added<sup>1,2</sup> (GVA) at current basic prices by region 1990 to 2002

<sup>1</sup> Estimates of regional GVA in this table are on a residence basis, where income of commuters is allocated to where they live rather than their place of work.

<sup>2</sup> Components may not sum to totals as a result of rounding.

The GVA for Extra-Regio comprises compensation of employees and gross operating surplus which cannot be assigned to regions.
 Provisional

## Gross Value Added $^{1,2}$ (GVA) by component of income at current basic prices by region 1990 to 2002

<sup>1</sup> Estimates of workplace based GVA allocate incomes to the region in which commuters work.

<sup>2</sup> Components may not sum to totals as a result of rounding.

<sup>3</sup> Provisional
4 The GVA for Extra-Regio comprises compensation of employees and gross operating surplus which cannot be assigned to regions

#### Appendix A

#### **Background notes**

#### **European System of Accounts 1995 (ESA95)**

1. The estimates of GVA published in this article are consistent with the *European System of Accounts 1995* (*ESA95*). ESA95 is based on the *System of National Accounts 1993* (*SNA93*)<sup>5</sup> which was sponsored by all major international organisations and is being adopted worldwide. The European system, which is being adopted by European Union Member States, is consistent with SNA93 but is more specific and prescriptive in certain parts. *Introducing the European System of Accounts 1995*<sup>6</sup>, *National Accounts Concepts, Sources and Methods* (1998)<sup>7</sup>, and *Regional Accounts Methods*<sup>8</sup> give more detail of the changed system of accounts, and the particular effects on the UK.

#### **Regional GVA at basic prices**

- 2. The regional GVA estimates presented in this article are consistent with the national accounts published in the *United Kingdom National Accounts 2003* (*The Blue Book*), which also defines the terms used. Regional GVA estimates for 2003, consistent with the 2004 edition of the *Blue Book*, will be published in December 2004.
- 3. Under ESA95, the term GVA is used to denote estimates that were previously known as Gross Domestic Product (GDP) at basic prices. Under ESA95 the term GDP denotes GVA plus taxes (less subsidies) on products, that is, at market prices. Regional accounts are currently only published at basic prices, so the figures are now referred to as GVA rather than GDP as in previous publications.

#### **Geography**

4. The Nomenclature of Units for Territorial Statistics (NUTS) provides a single uniform breakdown for the production of regional statistics for the European Union. There are three levels of NUTS in the UK:

NUTS1: Government Office Regions and Scotland, Wales and Northern Ireland.

NUTS2: 37 areas – sometimes referred to as sub-regions.

NUTS3: 133 areas – generally groups of unitary authorities or districts, also known as local areas.

Some areas appear at more than one level, for example, Northern Ireland appears at NUTS levels 1 and 2.

- 5. The GVA estimates relate to the nine Government Office Regions of England, as well as totals for Scotland, Wales and Northern Ireland. These form level 1 of the NUTS geography described above.
- 6. GVA for 1995 to 2003, giving figures for the UK broken down into the 37 NUTS2 and 133 NUTS3 areas, are due to be published in December 2004 in the form of an ONS News Release.

#### Regional GVA – concepts and definitions

- 7. In this article GVA is measured as the sum of incomes earned from the production of goods and services in the region. Insufficient information is available to estimate GVA for all regions of the UK using either the production or expenditure approaches. Estimates of GDP for Scotland only, based on the production approach, and measured in terms of constant (real) prices are published quarterly by the Scottish Executive. An article detailing the methodologies used is given in the 2001 edition of *Scottish Economic Statistics*.
- 8. As described above, the estimates of regional GVA in this article are calculated as the sum of incomes earned from productive activity in the region. The income (referred to CoE under ESA95) of commuters should therefore be included in the region where they work. Historically, however, the estimates of regional GVA have not been compiled on this basis; but have instead been compiled using regional estimates of CoE on a residence basis, because this was the basis of the most reliable data source (the one per cent sample of Inland Revenue national insurance records). This has a significant effect on the estimates for London, the South East and the East of England regions, but is assumed not to introduce any significant distortion of the other regions. Estimates of GVA on a residence basis are given in Tables 1 to 3 of this article.
- 9. Figures allocating the CoE to employees' workplace (the preferred GVA approach) are also included in Table 4 of this article. The workplace-based CoE figures for London, the South East and the East of England are based on regional data from the STES and New Earnings Survey (NES).
- 10. Unless otherwise stated, all references in this article to regional GVA refer to residence-based figures.

#### **Extra-Regio**

11. The contribution to GVA of UK embassies abroad and UK forces stationed overseas is included in Extra-Regio, along with the element of GVA relating to activities taking place on the continental shelf. As these cannot be assigned to specific regions they are assigned as 'Extra-Regio GVA'.

#### **Treatment of commuting in regional GVA estimates**

12. Regional GVA can be calculated both on a residence and a workplace basis. Residence-based GVA allocates the incomes of commuters to where they live, whereas workplace GVA allocates their incomes to where they work. The GVA estimates presented here are on a residence basis, and the breakdown of the totals by components of income and by industry are currently only available on a residence basis. However, workplace based estimates are also provided in Table 4. The residence and workplace estimates are different from each other only in the regions of London, the South East and the East of England. For all other regions it has previously been determined from the Census of Population that net commuting between regions is not significant.

#### **General**

- 13. All the items in regional accounts are measured in current prices, which means that increases over time reflect inflation as well as real growth. Trends in total GVA per head of population cannot be analysed easily without deflating the data. However, there are no regional price indices that could be used to remove the effect of inflation from the figures. Comparisons of trends can therefore be based either on the difference between regional increases at current prices or on movements in the amount relative to the UK average. Both approaches would be misleading if the rate of inflation in any region were different from the national average.
- 14. In the regional accounts it is usual to look at changes per head relative to the UK average over time. However, this obscures the effect of changes in population size. In areas where the population is increasing most rapidly, growth in total GVA would be expected to grow relatively strongly; conversely, areas with a low or negative population growth would be expected to grow more slowly.
- 15. 1989 to 2002 regional GVA per head figures will feed into the regional growth baselines calculated for the regional economic performance PSA target, jointly shared by DTI, HMT and ODPM. However, the regional GVA figures do not take account of the impact of price inflation at either the national or regional level. Due to this, the growth rates in this current price GVA per head series will not necessarily be comparable with any forthcoming regional growth baselines that will be set for this PSA target. The latter will be adjusted by statisticians in the DTI to take account of the impact of inflation at the regional level.

#### **Accuracy**

- 16. Although calculated as reliably as possible, estimates of regional GVA will not be as reliable as those for national GVA.
- 17. The regional GVA estimates are partly based on sample surveys and the quality of the results therefore varies according to sample size. This means that the results for smaller regions are subject to a greater degree of uncertainty than those for larger regions.
- 18. This article contains only a summary of the information available. A more detailed breakdown of manufacturing, and total regional CoE information are available on request from the Customer Contact Centre, Office for National Statistics, Room 1015 Government Buildings, Cardiff Road, Newport, NP10 8XG, tel: 0845 601 3034, fax: 01633 652747, e-mail: info@statistics.gsi.gov.uk
- 19. Details of the policy governing the release of new data are available from the ONS Press Office, tel: 020 7533 5725.
- 20. National Statistics are produced to high professional standards set out in the National Statistics Code of Practice. They undergo regular quality assurance reviews to ensure that they meet customer needs. They are produced free from any political interference.

# Jobs in the public sector, mid-2003

## Ole Black, Ian Richardson and Rhys Herbert

Office for National Statistics

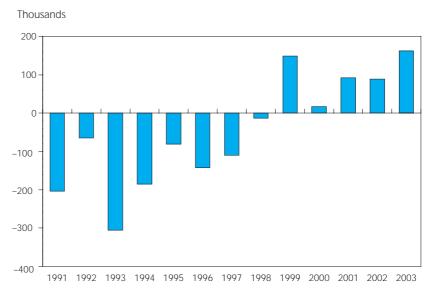

162,000 additional jobs were created in the public sector in the year to June 2003, considerably more than the 89,000 for the previous year. Employment in the public sector is now 10 per cent higher than in 1998, due to the creation of an additional 509,000 jobs. The fastest growing areas of public sector employment are where there has been the largest additional public spending. Education and health had the bulk of the job gains in 2003, with 88,000 in education and 63,000 in health. Private sector jobs grew by 98,000 in the year to June; a much more rapid gain than over the previous twelve months.

#### Introduction

This is the latest in a series of annual articles on jobs in the public and private sectors. This article updates the figures to June 2003. Data for most employment categories are now available for that date although a few minor categories have had to be estimated (Appendix 1 contains details of the latest employment data available for each area of government). The article first looks at both the latest figures for public sector jobs and their historic context. It then goes on to look at relative movements in public and private sector jobs.

Figure 1

Annual changes in public sector employment; 1991 to 2003

#### **Developments in public sector employment**

The data in this article are derived from administrative sources and a survey of local authorities. More detail on these sources, including an explanatory table, is provided in Appendix 1. Appendix 2 gives a detailed definition of the public sector. A new table, Table 2, has also been included, providing recent information on the number of Civil Service jobs.

Table 1 summarises the history of UK public sector employment over the past 40 years and its current composition. The data for total public sector jobs in the table are for the UK as a whole. Many functions that are carried out by local authorities in Great Britain are classified to central government in Northern Ireland. In previous articles, NHS employment was split between central government employees and employees of NHS trusts, which were classified as public corporations. Now NHS

trusts have been reclassified as part of central government, see link http://www.statistics.gov.uk/about/Methodology\_by\_theme/NHS\_Foundation\_Trusts/default.asp

The data for the Civil Service in Table 1 is supplied by the Cabinet Office and relate to Great Britain only. Northern Ireland civil servants are, however, included in the total public sector estimates. Civil servants work primarily in central government but some would also be in public corporations such as the Royal Mint.

Last year, 162,000 new jobs were created in the public sector, an increase on the 896,000 for the previous year. Employment in the public sector is now 10 per cent higher than in 1998, due to the creation of an additional 509,000 jobs. The growth in the last five years is a clear break from the trend of the immediately preceding period when jobs in this sector had fallen for over fifteen years in a row. This increase in employment in recent years is in line with the faster rate of growth in public spending.

Table 1

UK public sector employment 1963–2003 by major categories: headcounts, midyear, not seasonally adjusted<sup>1</sup>

The fastest growing areas of public sector employment are where there has been the largest additional public spending. Education and health again had the bulk of the job gains in 2003, with 88,000 in education and 63,000 in health. Other central government employment and police added 22,000 and 9,000 respectively. It should be noted that about 3,000 of the 22,000 rise in other central government is due to Northern Ireland education. Areas of the public sector which saw jobs disappear last year include social services and local authority construction. A fall in the latter category has occurred in most years over the last decade or so and reflects a policy change under recent governments to move from directly employed construction staff to buying services from the private sector.

Despite the fact that the number of public sector jobs has increased in recent years, the current totals are still well below the levels seen in the 1970s and 1980s. However, care has to

be taken in making such long-term comparisons, as moves are sometimes a result of definitional changes. For example, the biggest single cause of the fall over that period was the reclassification of corporations following privatisation. But at the same time employment in the Civil Service has fallen significantly in the last two decades and the number of service personnel has fallen by over 100,000 jobs since the end of the Cold War. Employment in health has been much steadier, while employment in education, after falling in the early 1990s, has steadily rise in more recent years. Together, these two now account for just under sixty per cent of total public sector employment compared with around forty per cent twenty years ago.

Table 2, which is included for the first time, provides a more detailed breakdown of civil service jobs. The numbers are for Great Britain only and are supplied by the Cabinet Office.

Figure 3 Composition of public sector jobs; 1983, 1993, 2003

100

The number of Civil Service jobs in October 2003 was up by 19,000 when compared with the same month in 2002.

## Public and private sector jobs – across the whole economy

The best measure of the number of jobs in the economy as a whole is that provided by the Labour Force Survey (LFS), which is a survey of households. An alternative measure, known as Work Force Jobs (WFJ), derived from surveys of businesses, provides the best estimate of the industrial composition of jobs. Neither the LFS, nor WFJ, however, provides a satisfactory estimate of public sector jobs, or of the allocation of total jobs between public and private sectors.

The LFS over-estimates the number of public sector jobs because of errors in self-classification by households. Errors occur for example when employees of publicly funded bodies, such as universities, incorrectly classify themselves as public sector. Universities are, in fact, part of the private sector in the National Accounts. Similarly, employees of private sector companies providing contracted out services to the public sector can incorrectly classify themselves as public sector employees. As part of the National Statistics Quality Review of Employment and Jobs, a pilot project to link LFS responses to the Inter-Departmental Business Register was initiated in spring 2004. Initial fieldwork has been completed and analysis of the results is ongoing. If successful, the linking project should reduce the extent of sectoral mis-classification in the LFS.

#### Notes

The WFJ series is not disaggregated between public and private sectors but is analysed by industrial category. One category covers public administration, defence and compulsory social security, which should be assumed to be wholly public sector. Two other categories are health and education, but these include both public and private sector jobs.

In these circumstances the only satisfactory method of estimating the number of private sector jobs is as the difference between the number of jobs in the economy as a whole and the number of public sector jobs estimated independently, as in this article. We concentrate initially on private sector jobs calculated as the difference between public sector jobs and the total number of jobs measured by the LFS – ONS's preferred measure of aggregate employment. This is discussed later in the article in the context of jobs by industry. This methodology was first employed in last year's article but earlier articles in this series considered private sector jobs as the difference between directly measured public sector jobs and total WFJ.

Table 3 gives the figures for the whole economy derived from the Labour Force Survey (LFS) and the estimates of public sector jobs reported in this article for the period up until the middle of 2003. The number of jobs in the economy as a whole grew over this period, despite the fact that output was only beginning to recover from a period of below trend growth. During the year to mid-2003 the total number of jobs grew by 260,000. The bulk of these job gains were accounted for by the 162,000 rise in public sector jobs while, in contrast, private sector jobs only grew by 98,000. Nevertheless, this growth in private sector job growth exceeded the 44,000 recorded in the previous year. However, given that the number of self-employed went up by over 200,000 in the year to mid-2003, most of the number of employee jobs in the private sector would have fallen over this period.

#### Public and private sector jobs – by industry

Table 4 presents an analysis of the industrial make up of public and private sector jobs, based on the workforce jobs (WFJ) data source, which provides more reliable industry detail than the LFS. This table derives total employee jobs as WFJ less the self-employed, HM Forces and Government-supported trainees. The total number of employee jobs (column 5 of Table 4) is then subdivided in the next eleven columns by industry, giving the breakdown between private and public sector employment for each.

The yearly movements in private sector jobs shown by Table 4 differ from those shown in Table 3, in which the LFS is used as the source of total jobs across the economy. This is because the two data sources do not always move together in the short term. For example WFJ shows faster jobs growth across the whole economy than the LFS in 2003, after showing slower jobs growth in 2002. On a longer time scale, however, the two series are much more consistent.

<sup>1.</sup> LFS data refer to March-May for the years 1992–1994 and May-July for 1995 to 2003.

<sup>2.</sup> LFS jobs equals LFS employment data plus the additional jobs of workers with second jobs.

<sup>3.</sup> Administrative data used in this article.

<sup>4.</sup> Estimated as the difference between LFS total employment and the administrative estimate of public sector jobs.

3. Total Public Sector equals Public Sector Employee Jobs plus HM Forces.

206

96

As Figure 4 shows, despite the recent job gains in the public sector, the private sector still accounts for almost 80 per cent of employee jobs. The composition of the two sectors in 2003 is, not surprisingly, very similar to that in 2002. The private sector is the dominant employer in production and construction and in 'other' – the category that contains the bulk of private sector service jobs. In contrast, the public sector is the dominant employer in health, education and public administration. It is worth noting that in the area of health, employment increased in both the private and public sectors last year. In contrast, while the number of public sector education jobs went up sharply last year, the number of jobs in this area in the private sector fell. However, this particular estimate does seem to be particularly volatile from year to year.

#### Revisions from last year's article

The revisions to public sector jobs since last year's article are shown in Table 5. The revisions are relatively small, and largely reflect additional quality assurance. The column showing Civil Service jobs has been revised for 1995 and later years to include casual staff, to be consistent with earlier data.

These were already included in total public sector jobs and so do not affect the overall total. Revisions to workforce jobs were published in April 2004 and are explained in this link to the National Statistics website http://www.statistics.gov.uk/cci/nugget.asp?id=892

Earlier revisions to self-employed figures are shown in this link http://www.statistics.gov.uk/cci/nugget.asp?id=207

#### **APPENDIX 1**

## How do we measure public sector employment?

The public sector numbers that are reported in this article are derived from the relevant administrative departments plus a comprehensive inquiry of all 443 local authorities in England and Wales. This is consequently the most comprehensive source available to us, although unfortunately some of the data, is only available with a considerable lag. Local authorities supply a single figure for all non-police staff. This is then broken down into the categories of education, social services, construction, police and other local government by using the Inter-Departmental Business Register local unit

information. Subtracting the public sector figures from the employment totals obtained from the Labour Force Survey (LFS) and workforce jobs (WFJ) derives the estimates for private sector employment that are used used here.

Table 6 reports the data source and the date of the latest data available. Column 4 records the figure used in the article to calculate the public sector jobs total as of June 2003. It can be seen that in few cases the latest data available was for a date before that point but these areas constitute only a very small part of the overall total.

ONS is currently investigating how more timely estimates of public sector employment could best be obtained.

Table 6 **Sources of public sector data** 

	Area	Main Source	Latest Data	Estimate at June 2003 (thousands)
Central Government:				
HM Forces	UK	Ministry of Defence	December 2003	206
NHS (inc. NHS Trusts)	England	Department of Health	September 2003	1,133
	Wales	Welsh Assembly Government	September 2002	81
	Scotland	NHS in Scotland Common Services Agency	September 20032	141
	Northern Ireland	Northern Ireland Office (DETI)	December 2003	65
Other Central Government	GB	Cabinet Office	October 2003	519
	Northern Ireland	Northern Ireland Office (DETI) – includes education and police	December 2003	109

Local Government:				
Education	England and Wales	Quarterly Local Authority Inquiry	December 2003	1,343
	Scotland	Joint Staffing Watch	December 2002	107
Social Services	England and Wales	Quarterly Local Authority Inquiry	December 2003	299
	Scotland	Joint Staffing Watch	December 2002	52
Construction	England and Wales	Quarterly Local Authority Inquiry	December 2003	35
	Scotland	Joint Staffing Watch (housing)	December 2002	10
Police	England and Wales	Home Office	September 2003	206
	Scotland	Joint Staffing Watch	December 2002	21
Other Local Government	England and Wales	Quarterly Local Authority Inquiry	December 2003	613
	Scotland	Joint Staffing Watch (excluding transport)	December 2002	103
	Northern Ireland	District and Parish Councils employment	December 2003	27
Public Corporations:				
Public Corporations	UK	Returns from the <i>Public Bodies</i> publication (Annual)	March 2003	386

More than one source of total UK employment data is available. The concept can be measured in more than one way. For example, it can be measured by directly surveying employees or by surveying employers. Conceptually, this article looks at the number of jobs rather than the number of employed people as only jobs can be allocated to a sector. The two main job series produced by ONS data are Workforce Jobs and the series derived from the Labour Force Survey. The former estimate combines the public sector jobs with quarterly and monthly short-term employment surveys of businesses. The results for businesses are updated every December as a result of the much more comprehensive Annual Business Inquiry (ABI). In contrast, the Labour Force Survey is a continuous monthly household survey. This survey does ask respondents to classify the sector of their employers, but in the past such self-classification has proven to be less reliable because respondents often do not know the correct classification of their employer.

By collecting job data from both employees and employers we get a much more rounded picture of economic developments but there is also a disadvantage, at least in the short term, in that the process results in two different measures of the level of employment. Indeed sometimes, the two surveys can even send out different messages about the direction of recent employment moves. Following recommendations from the National Statistics Quality Review of Employment and Jobs,

an exercise is underway to identify and then quantify as far as possible the difference between the two jobs measures.

This reconciliation considers differences relating to coverage, survey structure, definitions and estimation, both at national and government office region level and also over time. The current position of ONS is that our preferred estimate of total employment is the one derived from the LFS, while workforce jobs is most useful as a measure of industrial detail. A detailed breakdown of the various data categories can be obtained at http://www.statistics.gov.uk/statbase/Product.asp?vlnk=7163.

#### **APPENDIX 2**

#### **Definition of the public sector**

The domestic economy features units, which can be described as being either public or private sector units. The **public sector** comprises central government, local government and public corporations as defined for the UK national accounts.

Central government includes all administrative departments of government and other central agencies and most Non Departmental Public Bodies. City Academies, the first three of which were opened in 2002, are also classified to central government.

Local government includes all government units with a local remit. The sub sector includes all areas of administrative authorities including parish councils and local authorities with special functions. It includes magistrates courts, the probation service in England and Wales and police forces and their civilian staff. All functions of local authorities are classified to the sub sector, although trading activities which produce market output (for example, housing and municipally owned markets) are regarded as quasicorporations and appear under public corporations.

Local Education Authorities (LEAs) are part of local government, as are voluntary aided schools, county schools and, from September 1999, grant maintained schools (which were reclassified from central government).

Polytechnics and Higher Education colleges were transferred from local authority control in April 1989, as were Further Education and sixth form colleges from April 1993. Like universities, these institutions are part of the private sector and classified as non-profit institutions serving householdsNPISH.

**Public corporations** are companies or quasi-corporations (organisations which behave like corporations) controlled by government. Examples include BNFL and Royal Mail. These companies receive more than half their income from the sales of goods or services into the market place.

Lists of central and local government units and public corporations are shown in the Sector Classification Guide on the National Statistics website (see references).

#### Notes to tables

#### **Identification codes**

The four-letter identification code at the top of each data column is the ONS reference for this series of data on our database. Please quote the relevant code if you contact us requiring any further information about the data.

#### **Currency of data**

All data in the tables and accompanying charts are current, as far as possible, to 2 July 2004.

Some data, particularly for the latest time period, are provisional and may be subject to revision in later editions.

#### Geographic coverage

Statistics relate mainly to the United Kingdom. Where figures are for Great Britain only, this is shown on the table.

#### Seasonal adjustments

Almost all quarterly data are seaonally adjusted; those not seasonally adjusted are indicated by the abbreviation NSA.

#### Money

There is no single correct definition of money. The most widely used measures are:

#### MO

This is the narrowest measure and consists of notes and coins in circulation outside the Bank of England and bankers' operational deposits at the Bank.

#### M4

This comprises notes and coin in circulation with the public, together with all sterling deposits (including certificates of deposit) held with UK banks and building societies by the rest of the private sector.

The Bank of England also publish data for liquid assets outside M4.

#### Conventions

Rounding may lead to inconsistencies between the constituent parts and the total in some tables. A horizontal line between two consecutive figures indicates that the figures above and below the line have been compiled on different bases and are not strictly comparable. Footnotes explain the differences.

Billion denotes one thousand million.

#### Symbols used

- .. not available
- nil or less than half the final digit shown
- a series for which measures of variability are given on page 145
- t data have been revised since the last edition; the period marked is the earliest in the table to have been revised
- average (or total) of five weeks

#### National Statistics Online

#### www.statistics.gov.uk

Users can download time series, cross-sectional data and metadata from across the Government Statistical Service (GSS), using the site search and index functions from the homepage. Many datasets can be downloaded, in whole or in part, and directory information for all GSS statistical resources can be consulted, including censuses, surveys, journals and enquiry services. Information is posted as PDF electronic documents, or in XLS and CSV formats, compatible with most spreadsheet packages.

#### **Time Series Data**

The time series data facility on the website provide access to around 40,000 time series, of primarily macroeconomic data, drawn from the main tables in our major economic and labour market publications. Users can download complete releases or view and download customised selections of individual time series.

Complete copies of *Economic Trends* can be downloaded from the following webpage:

http://www.statistics.gov.uk/statbase/ product.asp?vlnk=308

<sup>1</sup> Estimates are given to the nearest £million but cannot be regarded as accurate to this degree.

<sup>2</sup> Total household income *less* payments of income tax and other taxes, social contributions and other current transfers.

4 Gross household disposable income revalued by the implied Household and NPISH final consumption expenditure deflator (2000 = 100).

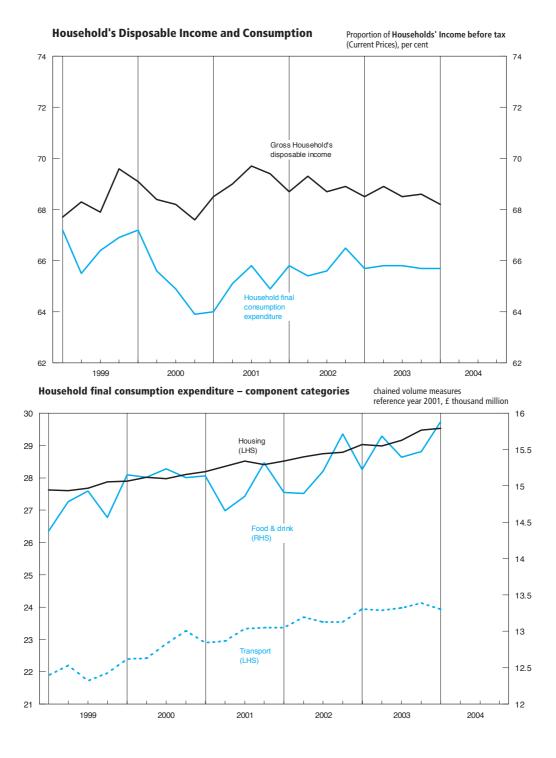

<sup>3</sup> Households saving as a percentage of Total resources; this is the sum

<sup>2</sup> More detailed estimates of Household Final Consumption Expenditure, expressed in both current prices and chained volume measures

and both unadjusted and seasonally adjusted appear in the ONS publication Consumer Trends.

<sup>3</sup> ESA 95 Classification of Individual Consumption by Purpose 4 Final consumption expenditure by UK households in the UK & abroad

<sup>5</sup> Final consumption expenditure in the UK by UK & foreign households Source: Office for National Statistics; Enquiries 020 7533 5999

<sup>2</sup> Weights may not sum to the totals due to rounding. The weights shown are in proportion to total gross value added (GVA) in 2001, and are used to combine the industry output indices to calculate the totals for 2002 and 2003. For 2001 and earlier, totals are calculated using the equivalent weights for the previous year (e.g. totals for 2001 use 2000 weights).

<sup>3</sup> Components of output are valued at basic prices, which excludes taxes and subsidies on production

#### Gross value added chained volume indices at basic prices, by category of output: **Service industries**

Public administration and national defence; compulsory social security.
 Comprising sections O, and P of the SIC(92).
 Comprises section J of the SIC(92). This covers activities of institutions such as banks, building societies, securities dealers, insurance companies and pension funds. It also covers institutions whose activities are closely related to financial intermediation : for example fund managers and insurance

<sup>4</sup> The weight and proxy series for financial intermediation are calculated before the deduction of interest receipts and payments to provide a better indication of the underlying activity for this section (see note 3). However, this overstates the contribution to GDP because interest flows should be treated as transfer payments rather than final consumption. The financial services adjustment, which has a negative weight, corrects for this.

5 See footnote 2 on Table 2.8

<sup>1</sup> All the indices are based on data expressed in US dollars.

<sup>2</sup> Excludes erratics (ships, North sea installations, aircraft, precious stones and silver bullion).3 Includes the former German Democratic Republic as from 1991 Q1.

<sup>4</sup> These series are on a SIC 92 basis.

<sup>This series is calculated using UK producer prices. All other country indices are wholesale price indices.
Quarterly data have been obtained by interpolating the annuals.

<sup>1</sup> Minor revisions have been made to seasonally adjusted figures previously published. These reflect the routine updating of the seasonal adjustment factor.

2 Data now include the Climate Change Levy introduced in April 2001 and the

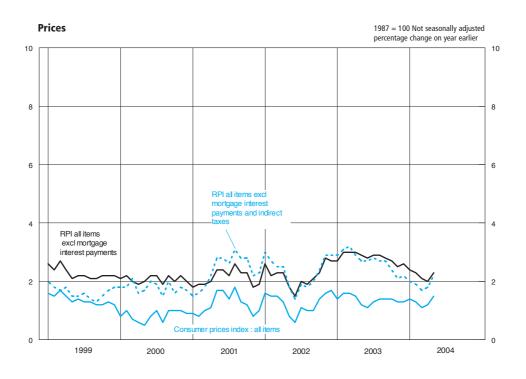

Aggregates Levy introduced in April 2002.

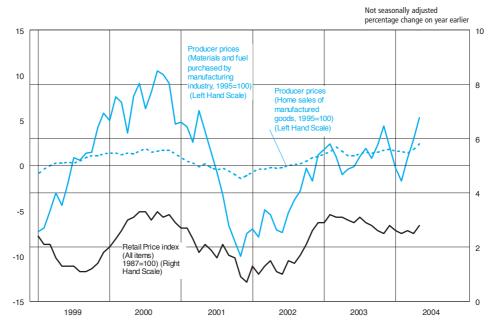

3 Inflation rates prior to 1997 and index levels prior to 1996 are estimated. Further details are given in *Economic Trends* No.541 December 1998.

pensioner household, based on RPI.

7 Movements in the purchasing power of the pound are based on movements in the retail prices index.

<sup>4</sup> Prior to 10 December 2003, the consumer prices index (CPI) was published in

<sup>1</sup> The data in this table have been adjusted to reflect the 2001 Census popu-

lation data.

2 Data are from the Labour Force Survey which uses the definitions recommended by the International Labour Organisation (ILO), an agency of the United Nations. For details see the Guide to Labour Market Statistics Releases.

<sup>3</sup> Seasonally adjusted estimates are revised in April each year.
4 The employment rate equals those in employment aged 16-64 (male) and 16-59 (female), as a percentage of all in these age groups. The underlying data are available on request.

- 1 Estimates of employee jobs and workforce jobs for Great Britain now use the Annual Business Inquiry as a benchmark on which quarterly movements are based. For further information see Labour Market Statistics First Release, April 2001 which is held on the National Statistics website www.statistics.gov.uk The Northern Ireland component of workforce jobs and employee jobs has not changed.
- 2 Workforce jobs comprise employee jobs, self-employed jobs, HM Forces and participants in work-related government supported training, which includes the Project Work Plan.
- 3 For all dates, individuals with two jobs as employees of different employers are counted twice.
- 4 Annual estimates relate to mid-year. Figures for the four quarters relate to March, June, September and December. For claimant count, unlike employment and workforce figures, the annual gure is an annual average.
- 5 Unadjusted claimant count figures have been affected by changes in the coverage. The seasonally adjusted figures however, as given in this table are estimated on the current basis, allowing for the discontinuities, except for the effect of the Jobseekeris Allowance introduced in October 1996 (see also below).
- The seasonally adjusted figures now relate only to claimants aged 18 or over in order to maintain the consistent series, available back to 1971 (1974 for the regions), allowing for the effect of the change in benefit regulations for under 18 year olds from September 1988. (See pages 398-400 of November 1995 *Labour Market Trends*.)
- 6 Claimant count figures do not include students claiming benefit during a vacation who intend to return to full-time education.
- 7 The denominator used to calculate claimant count unemployment rates is comprised of the workforce jobs plus the claimant count.
- 8 Vacancies notified to Jobcentres and remaining unfilled. Jobcentre vacancies only account for approximately one third of all vacancies in the economy. Note: Quarter figures relate to the average for the three months in the quarter.
- 9 Quarterly and annual values are now the mean of the monthly and quarterly data respectively.
- 0 Publication of the job centre vacancy statistics has been deferred. Figures from May 2001 are affected by the introduction of Employer Direct. This major change involves transferring the vacancy taking process from job centres to regional Customer Service Centres, as part of Modernising the Employment Service. ONS and the Employment Service will continue to monitor and review the data with the aim of publishing the series fairly soon, as it is possible to produce a consistent measure.

Note: Quarterly claimant count figures relate to the average of the three months in each quarter.

the effect of the change in benefit regulations for under 18 year olds from September 1988. (See pages 398 - 400 of the November 1995 Labour Market Trends.) The denominators used to calculate claimant count rates are the sum of the appropriate mid-year estimates of employee jobs, the self- employed, Government-supported trainees, HM Forces and claimants of unemploymentrelated benefits. The 2002 and 2003 rates are based on mid-2002 estimates and earlier years are based on the corresponding mid-year estimates. 3 Includes Merseyside.

Government Office Regions came into effect in April 1994. It was decided that from May 1997 sub-national data should be published for these areas rather than standard statistical regions (SSRs). Data by standard statistical regions are available on request.

<sup>2</sup> The seasonally adjusted figures now relate only to claimants aged 18 or over in order to maintain the consistent series, available back to 1971 for Great Britain, Northern Ireland and the United Kingdom (1974 for Wales and Scotland; 1986 for the Government Office Regions), allowing for

<sup>1</sup> The data in this table have been adjusted to reflect the 2001 Census population data. 2 Data are from the Labour Force Survey. Unemployment rate is the percentage of economically active people who are unemployed on the ILO measure.

<sup>3</sup> Includes Merseyside.
4 Seasonally adjusted estimates are revised in April each year.

<sup>1</sup> Provisional.

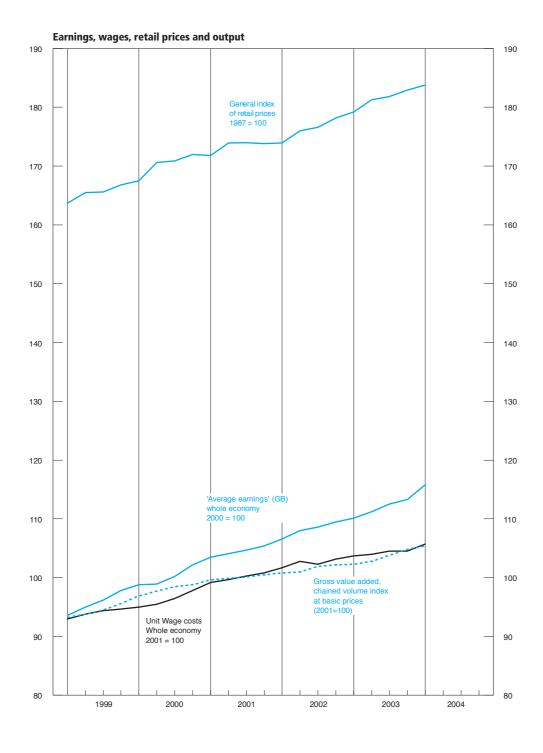

<sup>2</sup> The headline rate is the change in the average seasonally adjusted index values for the last 3 months compared with the same period a year ago.

Previously, the headline rate was centred on the middle month of the three under consideration. The new presentation aligns the average with the last

month of the three.

3 ONS regrets that the series have been withdrawn for the period 1963-1982, owing to an irregularity.

<sup>1</sup> The figures shown represent the output of United Kingdom based manufacturers classified to Subsections DK and DL of the Standard Industrial Clas-

<sup>3</sup> Net of cancellations.

<sup>4</sup> This index is based upon a gross output series which includes repair and maintenance estimates, unrecorded output by self-employed workers and small

Silication (2003).

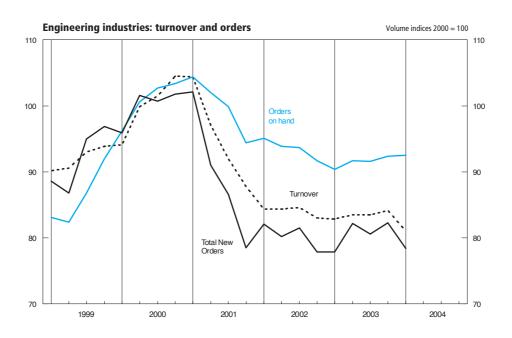

2 For Orders on Hand, the annual and quarterly index values represent the value at the end of the period in question, rather than the average value for that period, so the annual value shown for 2000 may not equal 100.

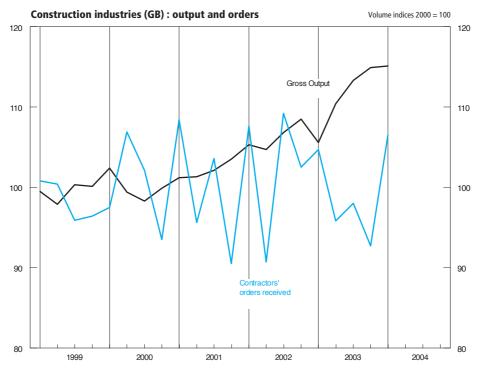

5 Data are subject to revisions following changes to the deflation methodology.

<sup>1</sup> Annual and quarterly figures are monthly averages.

<sup>2</sup> The totals are for 'usable steel' in accordance with the system used by the EC and the IISI, **but** in a change from previous publications, figures are actual production totals based on a four or five week period (not seasonally adjusted).

<sup>3</sup> Provisional.

<sup>4</sup> A seasonally adjusted series, based on the seasonal patterns of production from January 1999, has now been re-introduced. This affects the series from January 1999 only. Earlier data is based on previous production patterns. Sources: Office for National Statistics; Enquiries Columns 1-8 01633 812810; ISSB Ltd; Enquiries Column 9 020 7343 3900

www.odpm.gov.uk
2 Includes registered and non-registered social landlords.

<sup>3</sup> Series based on mortgage lending by all financial institutions rather than building societies only, as previously published. This change has been made necessary because of the mergers, takeovers and conversions to plc status affecting the building society sector. The series is based on the Office of the Deputy Prime Ministers' 5% Survey of Mortgage Lenders (at completion stage) up to 2003q2. From 2003q3, quarterly data are based on monthly data from the significantly enlarged Survey of Mortgage Lenders.

<sup>1</sup> The figures are based on counts of the relevant administrative forms successfully processed each month. For completions up to and including including November 2003 the relevant form was the Particulars Delivered form. Since December 2003 the relevant form is the Land Transaction Return associated with the introduction of Stamp Duty Land Tax (although in December 2003 most forms processed were still Particulars Delivered forms). The count of Land Transaction Return forms is based on the month when the Stamp Duty Land Tax certificate is issued. The figures for the the latest two months include estimates for returns where a certificate has been issued but the form was not captured on the database at the time the count was taken. The figures are therefore subject to revision next month

Other reasons for higher figures since the introduction of Stamp Duty Land Tax include (1) there are some types of transaction which require a Land Transaction Return which did not require a Particulars Delivered form and (2) there are higher numbers of registering commercial transactions.

- higher numbers of registering commercial transactions.

  3 Because of the time lags involved, the series above should be lagged by one month to give a broad representation of transactions completed in the month. However this relationship was weaker in the second quarter of 2002, because of the operational pressures in the network of Stamp Offices which delayed the processing of a proportion of property transactions.
- 4 The Jubilee celebrations meant that the late May bank holiday was taken in June 2002. Seasonal features in the data arising from the May Bank holiday will therefore not automatically be removed by the process of seasonal adjustment. Caution should therefore be taken when interpreting monthly movements involving May or June 2002 data.
- 5 The sum of seasonally adjusted components does not exactly match the unadjusted (definitive) annual total.

Source: Board of Inland Revenue; Enquiries 020 7438 6314

was taken. The figures are therefore subject to revision next month.

2 Because of the change in administrative arrangements associated with the introduction of Stamp Duty Land Tax, the figures from December 2003 onwards may not be comparable with the earlier series. In particular Land Transaction Returns in respect of transactions subject to Stamp Duty Land Tax are being submitted more promptly by conveyancers than Particulars Delivered forms in respect of transactions subject to stamp duty. The overhang of particulars delivered forms into the first quarter of 2004 has boosted the total property transactions processed figures in that quarter.

<sup>1</sup> Great Britain only. The motor trades are excluded. Information for periods earlier than those shown is available from ONS Newport (tel 01633 812509).

Sources: Office for National Statistics; Enquiries Columns 1-9 01633 812713; Columns 12-14 01633 812782.; Department of Transport; Enquiries Column 10,11 020 7944 3077.

<sup>2</sup> The retail sales index has been rebased using detailed information from the 2000 Annual Business inquiry. Further information is available via the National Statistics website: www.statistics.gov.uk

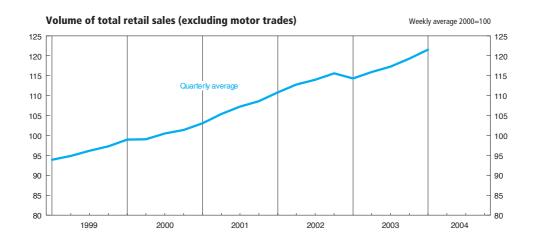

<sup>3</sup> Net lending equals changes in amounts outstanding adjusted to remove distortions arising from revaluations of debt such as write-offs.

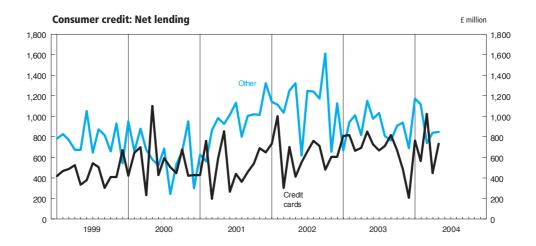

<sup>4</sup> Covers all institutions providing finance for consumers; including loans by banks on personal accounts and on bank credit cards and charge cards, by insurance companies, retailers and other specialist lenders, but excluding loans for house purchase.

for house purchase.

5 Seasonally adjusted data are not published in *Economic Trends* at present. Series DKBY ends in 1998 because seasonal adjustment has ceased; the existing model is not applicable to the new bi-annual registration system. It is published in the *Economic Trends Annual Supplement*.

<sup>1</sup> Average of daily Telegraphic Transfer rates in London.2 Prior to January 1999, a synthetic Euro has been calculated by geometrically averaging the bilateral exchange rates of the 11 Euro-area countries using "internal weights" based on each country's share of the extra Euro-area

<sup>3</sup> International reserves data are all valued at end-period market prices and exchange rates. They additionally include other reserve assets such as repos (sale and purchase agreements) and derivatives. Full details are shown in Table 1.2I of Financial Statistics.

<sup>4</sup> These figures fall outside the scope of National Statistics.

For most periods the relationships between the columns are as follows: 11 = 5+6+8; 12=9+10+11. Due to the inclusion of Public Sector Net Cash Requirement (PSNCR) information on a ESA95 basis, 10=1+2+3+4+7 from 1994/95 only. Because the latest available PSNCR information is included figures for more recent periods may not add exactly.

2 The M4 private sector comprises and building societies.
3 Formerly called the Public Sector Borrowing Requirement.
4 Columns 2 -12 do not contain National Statistics data.

<sup>1</sup> Comprises loans advances (including under reverse repos), finance leasing, acceptances, facilities and holdings of sterling commercial paper issued by UK residents, provided by reporting banks to their UK resident non-bank and non-building society customers. This analysis is based on Standard Industrial Classification of 1992 and excludes lending to residents in the Channel Islands and the Isle of Man which are classified as non-residents for statistical purposes from end-September 1997. Holdings of investments and bills and adjustments for transit items are no longer included. For a more detailed breakdown of these data, see Financial Statistics Table 4.5B.

Source: Bank of England; Enquiries 020 7601 5360

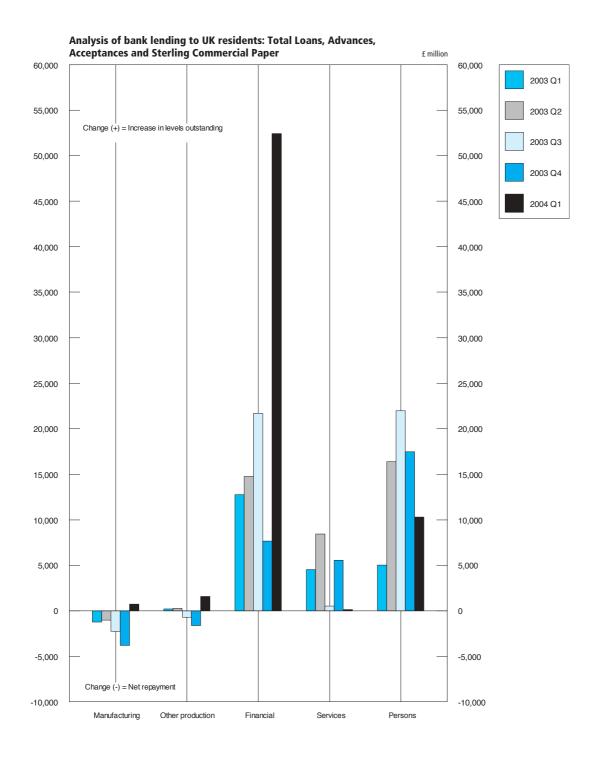

<sup>2</sup> Changes in the reporting population in the quarter to end-December 1997, including the entry of Northern rock plc, account for an increase of £12.8bn in total sterling lending. Other currency lending was unchanged.

Changes data have been adjusted to reflect only the new business undertaken by Northern Rock plc during the quarter.

<sup>3</sup> Includes lending under DTI special scheme for domestic shipbuilding. 4 In the quarter to end-June 1999, Halifx plc acquired Birmingham Midshires Building Society; adjustments have been applied so that only the growth in the

latter's business in the quarter is included in the aggregate flows.

5 Data for amounts outstanding to end-Q4, 2000 reflect the entry of Bradford and Bingley plc to the banking sector in December 2000. Changes data have been adjusted to reflect only the net business undertaken by Bradford and Bingley plc during December.
6 These figures fall outside the scope of National Statistics.

<sup>1</sup> Series based on mortgage lending by all financial institutions rather than building societies only, as previously published. This change has been made necessary because of the mergers, takeovers and conversions to plc status affecting the building society sector. The series is based on the Office of the Deputy Prime Ministers' 5% survey of mortgage lenders (at completion stage), but now includes all mortgage lenders rather than building societies only. From February 2002, monthly data has been obtained from the enlarged survey and quarterly data from 2002q2 are based on monthly in-

<sup>2</sup> Please note that because of some changes in coverage, the revised series from Q1 1993 is not directly comparable with the old series. From Q1 1993 prices of all sales of of agricultural land exclude some transfers in order to come closer to estimates of market determined prices. However the new series does not represent exactly competitive open market values. Sales are now analysed and recorded on the basis of when the transactions actually took place. Further information is available on the DEFRA Website (www.defra.gov.uk/esg/default.htm) accessible through the Internet. Data prior to 1993 remains on the previous basis.

<sup>3</sup> Provisional estimates

Households' saving ratio <sup>3</sup>	2.5	Q1 1985 to Q4 2003	1.0	0.9	0.4	2.2	2	0.7
Monthly series								
Retail sales (volume per week)								
Predominantly food stores	5.8	Jan 1986 to Dec 2003	0.6	0.6	0.2	2.4	3	0.8
Predominantly non-food stores	5.8	Jan 1986 to Dec 2003	1.1	1.0	0.4	2.4	3	0.8
Non-store and repair	5.8	Jan 1986 to Dec 2003	1.9	1.8	0.5	3.8	4	1.0
Index of industrial production								
Production industries	5.1	Jan 1985 to Dec 2003	0.7	0.7	0.2	3.1	4	0.9
Manufacturing industries	5.1	Jan 1985 to Dec 2003	0.7	0.7	0.3	2.5	3	0.8
Average earnings: whole economy	4.6	Jan 1990 to Dec 2003	0.4	0.3	0.4	0.7	1	0.7
Exports: value, f.o.b. <sup>4</sup>	2.13	Jan 1985 to Dec 2003	2.9	2.7	0.8	3.3	4	0.8
Imports: value, f.o.b. <sup>4</sup>	2.13	Jan 1985 to Dec 2003	2.3	2.1	0.8	2.7	3	0.8
Money stock - M0 <sup>5</sup>	6.2	Jan 1985 to Dec 2003	0.6	0.3	0.5	0.7	1	0.7
Money stock - M4 <sup>5</sup>	6.2	Jan 1985 to Dec 2003	0.8	0.3	0.8	0.4	1	0.4

<sup>1</sup> For a fuller description of these measures see article 'Measuring variability in economic time series' in Economic Trends, No 226, August 1972.

- The following are brief de nitions of the measures.
  CI is the average month to month (quarter to quarter for quarterly series) percentage change without regard to sign in the seasonally adjusted series.
- C is the same for the trend component.

  I is the same for the irregular component, obtained by dividing the trend component into the seasonally adjusted series, except for those series which are seasonally adjusted using an additive model, see footnotes 3 and
- $\underline{\underline{5.}}$   $\underline{\overline{C}}$  is therefore a measure of the size of the relative irregularity of the sea-

II' C is therefore a measure of the size of the relative irregularity of the seasonally adjusted series. \_\_\_ The average changes  $\overline{I}$  and  $\overline{C}$  can also be computed successively over spans of increasing numbers of months (quarters). MCD (QCD), months (quarters) for cyclical dominance, is the shortest span of months (quarters) for which  $\overline{II'}$   $\overline{C}$  is less than 1 and therefore represents the minimum period over which changes in the trend, on average, exceed the irregular movement

MCD cannot exceed 6 even if  $\overline{1/C}$  exceeds 1 for 6-month periods.

- 2 Series relate to Great Britain.
- The figures in the tables were obtained from an additive analysis of the households' saving ratio so Cl, I and C are differences in percentage points.
- 4 The figures have been updated as described in an article in Economic Trends,
- 5 As the irregular component for M0 and M $\underline{\text{4}}$  is obtained by subtraction of the trend rather than by division, the figures for CI, I and C are expressed as percentages of the trend level in the preceding month.
