LAND-USE MONITORING IN OECD URBAN AREAS

Alexandre Banquet, Paul Delbouve, Paolo Veneri (OECD/CFE) Michiel N. Daams (University of Groningen, Netherlands)

May 2022

Context and objectives

Context

- Land and built-up area major environmental and economic factors
- But land-use monitoring slow

Aim

Monitoring in near real-time land-use in OECD functional urban areas (FUA = city + commuting zone)

How?

By using public Sentinel satellite imagery data and Deep Learning models trained on the Copernicus urban atlas

Applications

- Urban expansion: speed, density, shape
- Land conversion (deforestation, afforestation, agricultural expansion)
- Land artificialisation, loss of natural areas

Indicator characteristics

- Near real-time, yearly indicators
- Coverage: European OECD FUAs, potentially non-European FUAs
- 10 m spatial resolution

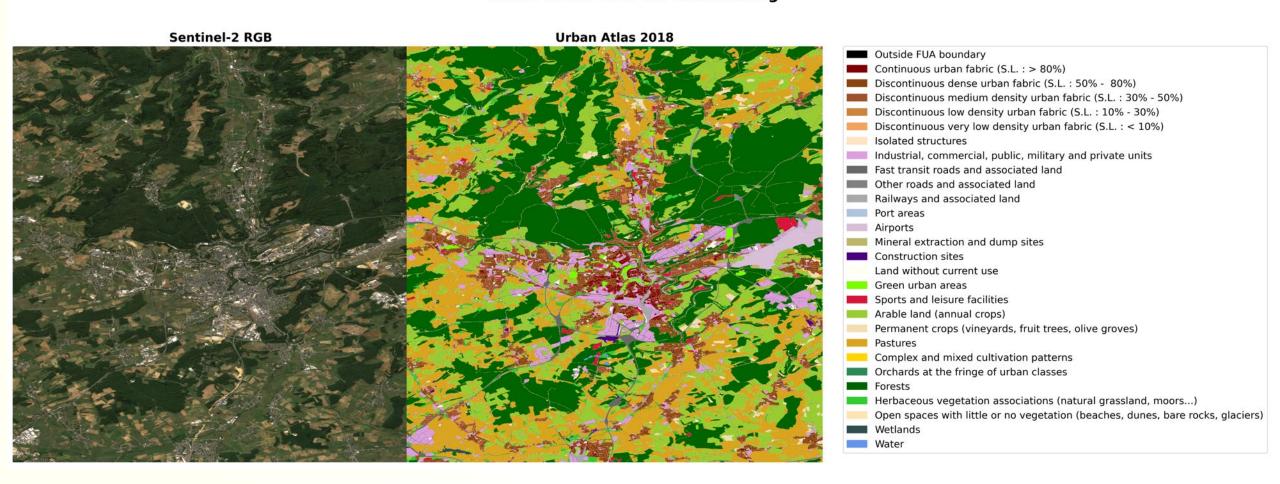

Sentinel satellite constellation

	Sentinel 1	Sentinel 2
Туре	Synthetic Aperture Radar (SAR) Active Sensors	Multi-spectral Passive Sensors
Resolution	10 m	10 - 30 m
Time revisit	6 days with 2 satellites	5 days with 2 satellites
Example		

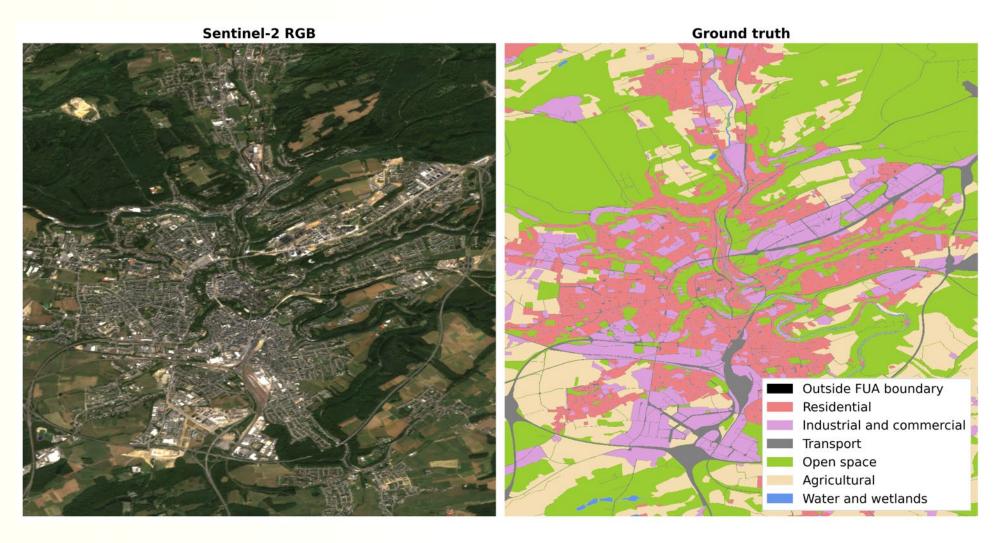

The Copernicus Urban Atlas

Urban Atlas 2018 for Luxembourg

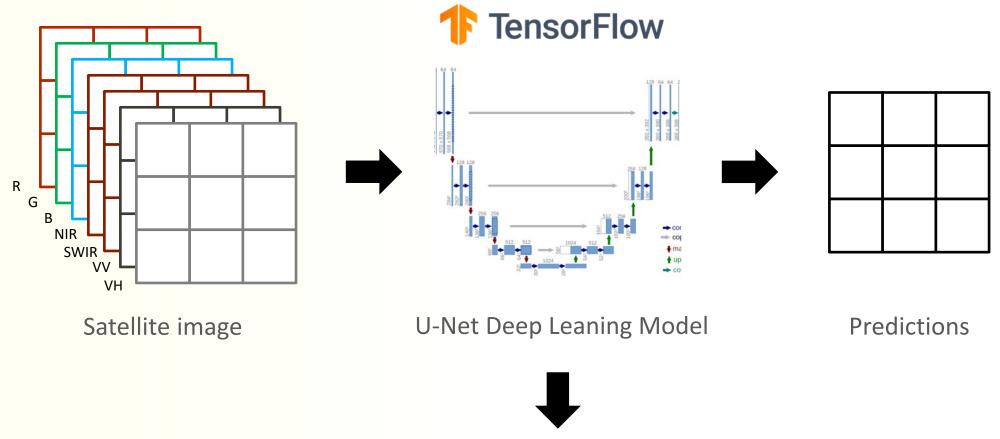

Class aggregation used in the analysis

Pipeline overview

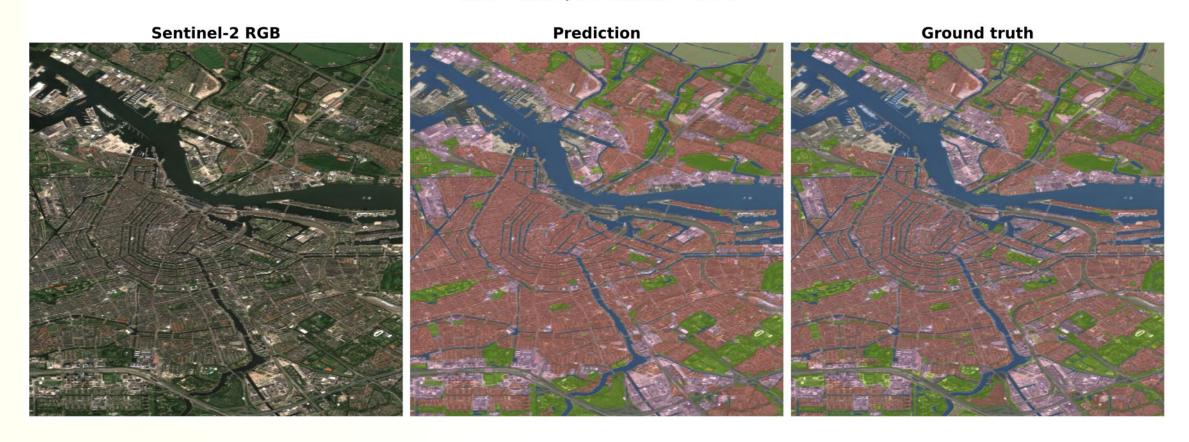

Training and testing with the EU urban atlas on aggregated classes

Model predictions on Amsterdam

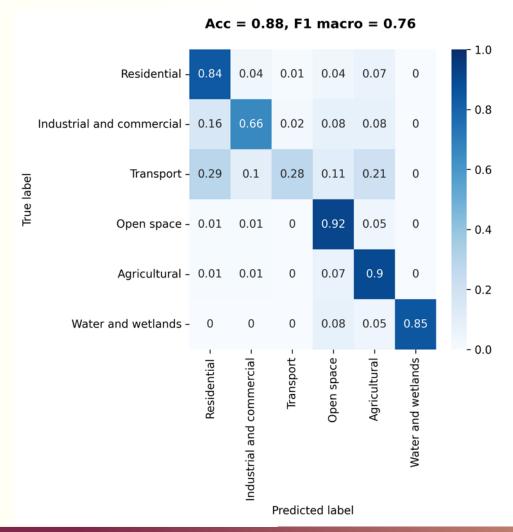

Amsterdam Acc = 0.85, F1 macro = 0.76

Overall performance very good, except for transportation networks

Accuracy	Results
1	Perfect
0.9-1	Excellent
0.7-0.9	Very Good
0.6-0.7	Good
0.4-0.6	Fair
0-0.4	Poor

Metropolitan area of San Francisco (2020) Residential Industrial and control | Residential | Residential

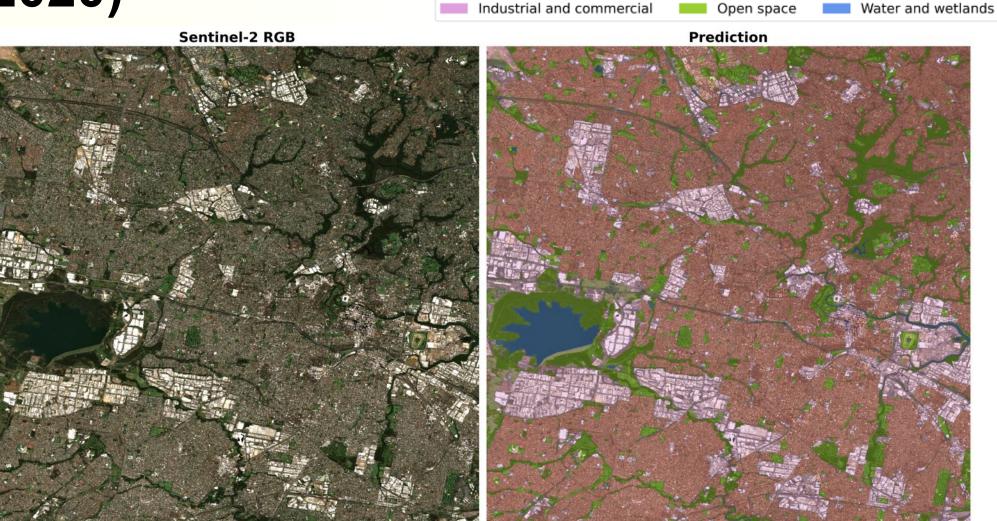

Agricultural

Transport

Metropolitan area of Sydney (2020) Residential Industrial and commercial

Metropolitan area of Bogota D.C. (2020) Residential Industrial and commercial

Agricultural

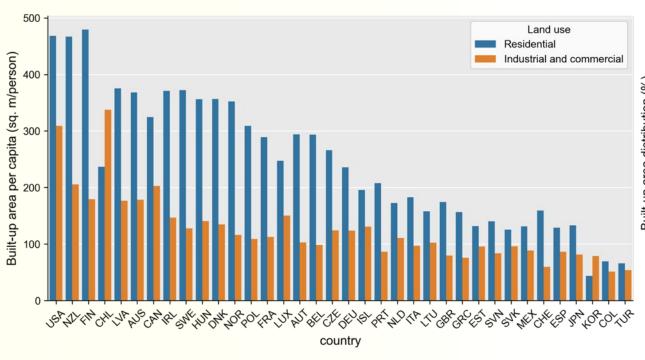

Transport

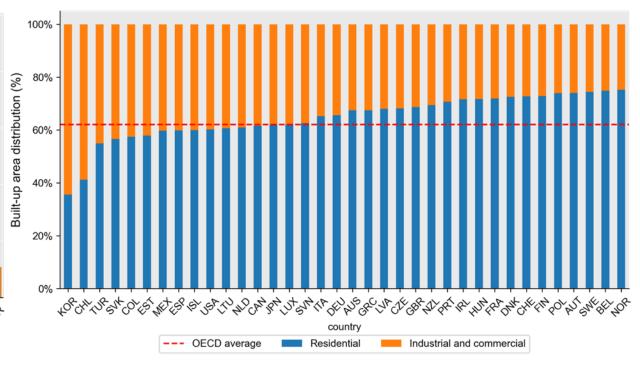

Built-up area per capita varies substantially across countries

Built-up area per capita and by land use, 2021

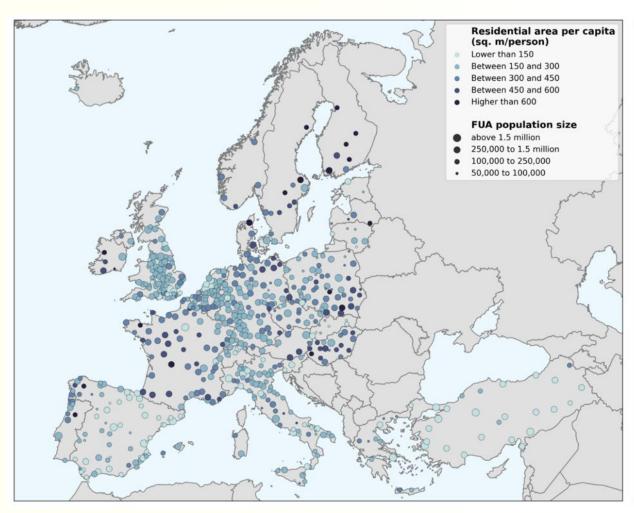

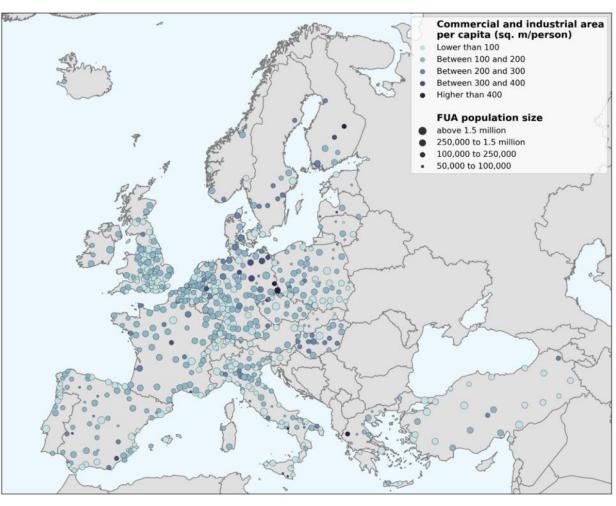

Distribution in built-up land use, 2021

Built-up area per capita varies substantially across cities

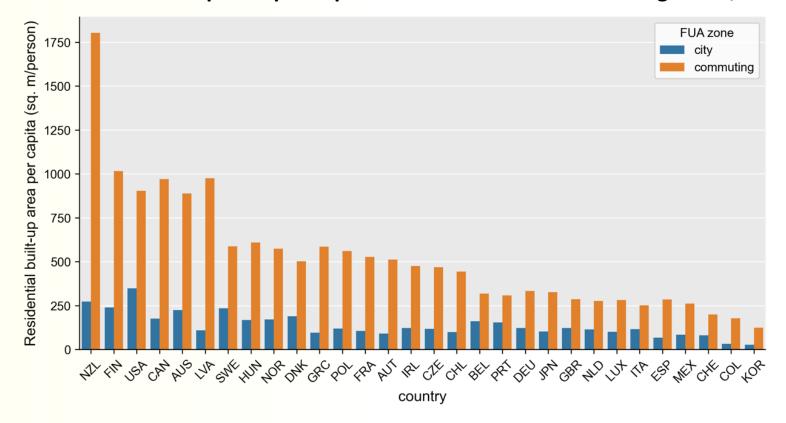

Built-up area per capita varies substantially between cities and commuting zones

Residential built-up area per capita in cities and their commuting zones, 2021

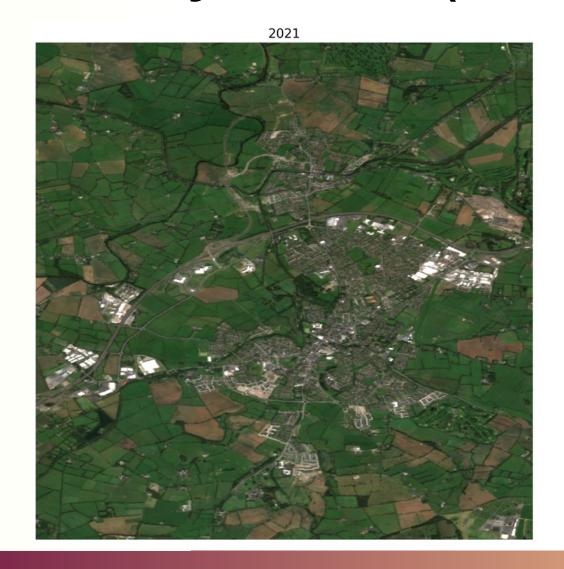

Example on the city of Naas (FUA of Dublin)

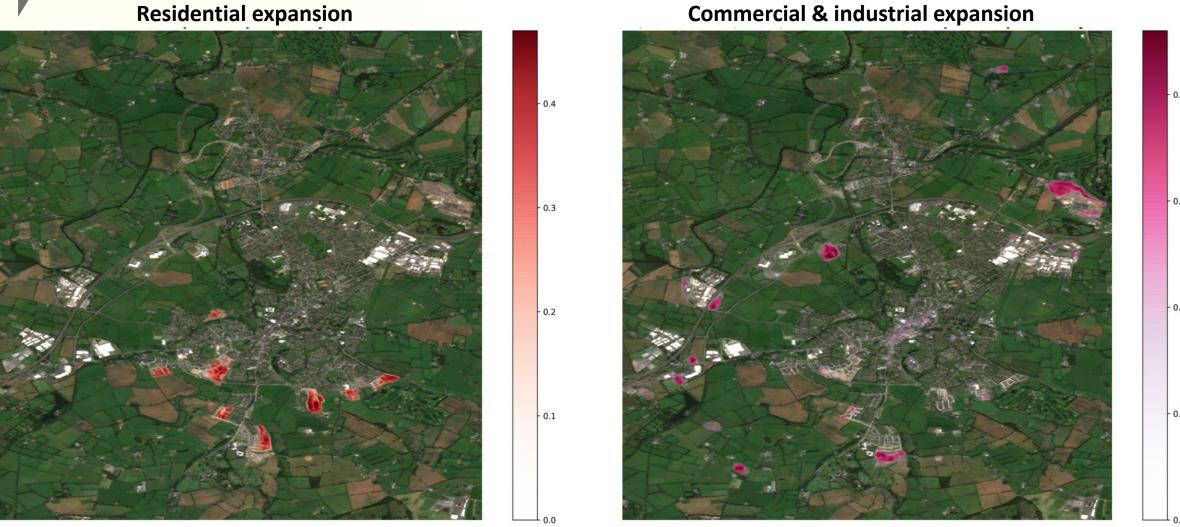

Example on the city of Naas (FUA of Dublin)

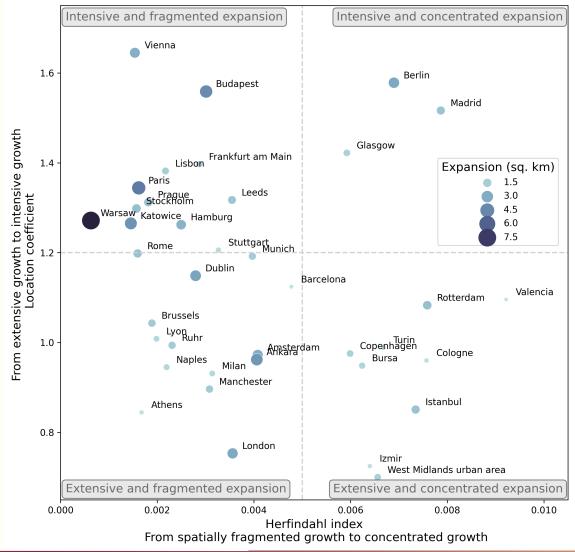

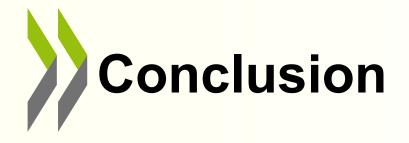

Example on the city of Naas (FUA of Dublin)

Speed and shape of urban expansion

- Model enabling to track land use in OECD cities:
 - Validation on European FUAs
 - Validation still necessary on non-European FUAs and for change detection
 - Working paper coming soon
- Challenges in the deployment of EO data in the public sector:
 - Important IT resources required
 - Various technical skills

Thank you!
